NAG Library Routine Document F08KNF (ZGELSS)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F08KNF (ZGELSS) computes the minimum norm solution to a complex linear least squares problem $\min \|b - Ax\|_2$.

2 Specification

```
SUBROUTINE FO8KNF (M, N, NRHS, A, LDA, B, LDB, S, RCOND, RANK, WORK, LWORK, RWORK, INFO)

INTEGER M, N, NRHS, LDA, LDB, RANK, LWORK, INFO

REAL (KIND=nag_wp) S(*), RCOND, RWORK(*)

COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), WORK(max(1,LWORK))
```

The routine may be called by its LAPACK name zgelss.

3 Description

F08KNF (ZGELSS) uses the singular value decomposition (SVD) of A, where A is an m by n matrix which may be rank-deficient.

Several right-hand side vectors b and solution vectors x can be handled in a single call; they are stored as the columns of the m by r right-hand side matrix B and the n by r solution matrix X.

The effective rank of A is determined by treating as zero those singular values which are less than RCOND times the largest singular value.

5 Parameters

M - INTEGER Input

On entry: m, the number of rows of the matrix A.

Constraint: M > 0.

2: N – INTEGER Input

On entry: n, the number of columns of the matrix A.

Constraint: $N \ge 0$.

Mark 24 F08KNF.1

F08KNF NAG Library Manual

3: NRHS – INTEGER

Input

On entry: r, the number of right-hand sides, i.e., the number of columns of the matrices B and X. Constraint: NRHS ≥ 0 .

4: $A(LDA,*) - COMPLEX (KIND=nag_wp)$ array

Input/Output

Note: the second dimension of the array A must be at least max(1, N).

On entry: the m by n matrix A.

On exit: the first min(m, n) rows of A are overwritten with its right singular vectors, stored rowwise.

5: LDA – INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08KNF (ZGELSS) is called.

Constraint: LDA $> \max(1, M)$.

6: B(LDB,*) - COMPLEX (KIND=nag wp) array

Input/Output

Note: the second dimension of the array B must be at least max(1, NRHS).

On entry: the m by r right-hand side matrix B.

On exit: B is overwritten by the n by r solution matrix X. If $m \ge n$ and RANK = n, the residual sum of squares for the solution in the ith column is given by the sum of squares of the modulus of elements $n+1,\ldots,m$ in that column.

7: LDB – INTEGER

On entry: the first dimension of the array B as declared in the (sub)program from which F08KNF (ZGELSS) is called.

Constraint: LDB $\geq \max(1, M, N)$.

8: $S(*) - REAL (KIND=nag_wp) array$

Output

Input

Note: the dimension of the array S must be at least max(1, min(M, N)).

On exit: the singular values of A in decreasing order.

9: RCOND - REAL (KIND=nag wp)

Input

On entry: used to determine the effective rank of A. Singular values $S(i) \leq RCOND \times S(1)$ are treated as zero. If RCOND < 0, **machine precision** is used instead.

10: RANK - INTEGER

Output

On exit: the effective rank of A, i.e., the number of singular values which are greater than RCOND \times S(1).

11: WORK(max(1,LWORK)) - COMPLEX (KIND=nag_wp) array

Workspace

On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimal performance.

12: LWORK – INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08KNF (ZGELSS) is called.

If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.

F08KNF.2 Mark 24

Suggested value: for optimal performance, LWORK should generally be larger. Consider increasing LWORK by at least $nb \times \min(M, N)$, where nb is the optimal **block size**.

Constraint: LWORK ≥ 1 and LWORK $\geq 2 \times \min(M, N) + \max(M, N, NRHS)$.

13: RWORK(*) - REAL (KIND=nag wp) array

Workspace

Note: the dimension of the array RWORK must be at least $max(1, 5 \times min(M, N))$.

14: INFO – INTEGER Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

The algorithm for computing the SVD failed to converge; if INFO = i, i off-diagonal elements of an intermediate bidiagonal form did not converge to zero.

7 Accuracy

See Section 4.5 of Anderson et al. (1999) for details.

8 Further Comments

The real analogue of this routine is F08KAF (DGELSS).

9 Example

This example solves the linear least squares problem

$$\min_{x} ||b - Ax||_2$$

for the solution, x, of minimum norm, where

$$A = \begin{pmatrix} 0.47 - 0.34i & -0.40 + 0.54i & 0.60 + 0.01i & 0.80 - 1.02i \\ -0.32 - 0.23i & -0.05 + 0.20i & -0.26 - 0.44i & -0.43 + 0.17i \\ 0.35 - 0.60i & -0.52 - 0.34i & 0.87 - 0.11i & -0.34 - 0.09i \\ 0.89 + 0.71i & -0.45 - 0.45i & -0.02 - 0.57i & 1.14 - 0.78i \\ -0.19 + 0.06i & 0.11 - 0.85i & 1.44 + 0.80i & 0.07 + 1.14i \end{pmatrix}$$

and

$$b = \begin{pmatrix} -1.08 - 2.59i \\ -2.61 - 1.49i \\ 3.13 - 3.61i \\ 7.33 - 8.01i \\ 9.12 + 7.63i \end{pmatrix}.$$

A tolerance of 0.01 is used to determine the effective rank of A.

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.
