

NAG Library Routine Document

F08QTF (ZTREXC)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08QTF (ZTREXC) reorders the Schur factorization of a complex general matrix.

2 Specification

```
SUBROUTINE F08QTF (COMPQ, N, T, LDT, Q, LDQ, IFST, ILST, INFO)
INTEGER                N, LDT, LDQ, IFST, ILST, INFO
COMPLEX (KIND=nag_wp) T(LDT,*), Q(LDQ,*)
CHARACTER(1)          COMPQ
```

The routine may be called by its LAPACK name *ztrexc*.

3 Description

F08QTF (ZTREXC) reorders the Schur factorization of a complex general matrix $A = QTQ^H$, so that the diagonal element of T with row index IFST is moved to row ILST.

The reordered Schur form \tilde{T} is computed by a unitary similarity transformation: $\tilde{T} = Z^H T Z$. Optionally the updated matrix \tilde{Q} of Schur vectors is computed as $\tilde{Q} = QZ$, giving $A = \tilde{Q}\tilde{T}\tilde{Q}^H$.

4 References

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

5 Parameters

- 1: COMPQ – CHARACTER(1) *Input*
On entry: indicates whether the matrix Q of Schur vectors is to be updated.
 COMPQ = 'V'
 The matrix Q of Schur vectors is updated.
 COMPQ = 'N'
 No Schur vectors are updated.
Constraint: COMPQ = 'V' or 'N'.
- 2: N – INTEGER *Input*
On entry: n , the order of the matrix T .
Constraint: $N \geq 0$.
- 3: T(LDT,*) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array T must be at least $\max(1, N)$.
On entry: the n by n upper triangular matrix T , as returned by F08PSF (ZHSEQR).
On exit: T is overwritten by the updated matrix \tilde{T} .

- 4: LDT – INTEGER *Input*
On entry: the first dimension of the array T as declared in the (sub)program from which F08QTF (ZTREXC) is called.
Constraint: $LDT \geq \max(1, N)$.
- 5: Q(LDQ,*) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array Q must be at least $\max(1, N)$ if COMPQ = 'V' and at least 1 if COMPQ = 'N'.
On entry: if COMPQ = 'V', Q must contain the n by n unitary matrix Q of Schur vectors.
On exit: if COMPQ = 'V', Q contains the updated matrix of Schur vectors.
 If COMPQ = 'N', Q is not referenced.
- 6: LDQ – INTEGER *Input*
On entry: the first dimension of the array Q as declared in the (sub)program from which F08QTF (ZTREXC) is called.
Constraints:
 if COMPQ = 'V', $LDQ \geq \max(1, N)$;
 if COMPQ = 'N', $LDQ \geq 1$.
- 7: IFST – INTEGER *Input*
 8: ILST – INTEGER *Input*
On entry: IFST and ILST must specify the reordering of the diagonal elements of T . The element with row index IFST is moved to row ILST by a sequence of exchanges between adjacent elements.
Constraint: $1 \leq IFST \leq N$ and $1 \leq ILST \leq N$.
- 9: INFO – INTEGER *Output*
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = $-i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed matrix \tilde{T} is exactly similar to a matrix $(T + E)$, where

$$\|E\|_2 = O(\epsilon)\|T\|_2,$$

and ϵ is the *machine precision*.

The values of the eigenvalues are never changed by the reordering.

8 Further Comments

The total number of real floating point operations is approximately $20nr$ if COMPQ = 'N', and $40nr$ if COMPQ = 'V', where $r = |IFST - ILST|$.

The real analogue of this routine is F08QFF (DTREXC).

9 Example

This example reorders the Schur factorization of the matrix T so that element t_{11} is moved to t_{44} , where

$$T = \begin{pmatrix} -6.00 - 7.00i & 0.36 - 0.36i & -0.19 + 0.48i & 0.88 - 0.25i \\ 0.00 + 0.00i & -5.00 + 2.00i & -0.03 - 0.72i & -0.23 + 0.13i \\ 0.00 + 0.00i & 0.00 + 0.00i & 8.00 - 1.00i & 0.94 + 0.53i \\ 0.00 + 0.00i & 0.00 + 0.00i & 0.00 + 0.00i & 3.00 - 4.00i \end{pmatrix}.$$
