

## NAG Library Routine Document

### F08TCF (DSPGVD)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

#### 1 Purpose

F08TCF (DSPGVD) computes all the eigenvalues and, optionally, the eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$$Az = \lambda Bz, \quad ABz = \lambda z \quad \text{or} \quad BAz = \lambda z,$$

where  $A$  and  $B$  are symmetric, stored in packed format, and  $B$  is also positive definite. If eigenvectors are desired, it uses a divide-and-conquer algorithm.

#### 2 Specification

```
SUBROUTINE F08TCF (ITYPE, JOBZ, UPLO, N, AP, BP, W, Z, LDZ, WORK, LWORK,      &
                  IWORK, LIWORK, INFO)
INTEGER          ITYPE, N, LDZ, LWORK, IWORK(max(1,LIWORK)), LIWORK,      &
                  INFO
REAL (KIND=nag_wp) AP(*), BP(*), W(N), Z(LDZ,*), WORK(max(1,LWORK))
CHARACTER(1)    JOBZ, UPLO
```

The routine may be called by its LAPACK name *dspgvd*.

#### 3 Description

F08TCF (DSPGVD) first performs a Cholesky factorization of the matrix  $B$  as  $B = U^T U$ , when  $UPLO = 'U'$  or  $B = LL^T$ , when  $UPLO = 'L'$ . The generalized problem is then reduced to a standard symmetric eigenvalue problem

$$Cx = \lambda x,$$

which is solved for the eigenvalues and, optionally, the eigenvectors; the eigenvectors are then backtransformed to give the eigenvectors of the original problem.

For the problem  $Az = \lambda Bz$ , the eigenvectors are normalized so that the matrix of eigenvectors,  $z$ , satisfies

$$Z^T A Z = \Lambda \quad \text{and} \quad Z^T B Z = I,$$

where  $\Lambda$  is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem  $ABz = \lambda z$  we correspondingly have

$$Z^{-1} A Z^{-T} = \Lambda \quad \text{and} \quad Z^T B Z = I,$$

and for  $BAz = \lambda z$  we have

$$Z^T A Z = \Lambda \quad \text{and} \quad Z^T B^{-1} Z = I.$$

## 5 Parameters

- 1: ITYPE – INTEGER *Input*  
*On entry:* specifies the problem type to be solved.  
 ITYPE = 1  
 $Az = \lambda Bz.$   
 ITYPE = 2  
 $ABz = \lambda z.$   
 ITYPE = 3  
 $BAz = \lambda z.$   
*Constraint:* ITYPE = 1, 2 or 3.
- 2: JOBZ – CHARACTER(1) *Input*  
*On entry:* indicates whether eigenvectors are computed.  
 JOBZ = 'N'  
 Only eigenvalues are computed.  
 JOBZ = 'V'  
 Eigenvalues and eigenvectors are computed.  
*Constraint:* JOBZ = 'N' or 'V'.
- 3: UPLO – CHARACTER(1) *Input*  
*On entry:* if UPLO = 'U', the upper triangles of  $A$  and  $B$  are stored.  
 If UPLO = 'L', the lower triangles of  $A$  and  $B$  are stored.  
*Constraint:* UPLO = 'U' or 'L'.
- 4: N – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrices  $A$  and  $B$ .  
*Constraint:*  $N \geq 0$ .
- 5: AP(\*) – REAL (KIND=nag\_wp) array *Input/Output*  
**Note:** the dimension of the array AP must be at least  $\max(1, N \times (N + 1)/2)$ .  
*On entry:* the upper or lower triangle of the  $n$  by  $n$  symmetric matrix  $A$ , packed by columns.  
 More precisely,  
     if UPLO = 'U', the upper triangle of  $A$  must be stored with element  $A_{ij}$  in  
     AP( $i + j(j - 1)/2$ ) for  $i \leq j$ ;  
     if UPLO = 'L', the lower triangle of  $A$  must be stored with element  $A_{ij}$  in  
     AP( $i + (2n - j)(j - 1)/2$ ) for  $i \geq j$ .  
*On exit:* the contents of AP are destroyed.
- 6: BP(\*) – REAL (KIND=nag\_wp) array *Input/Output*  
**Note:** the dimension of the array BP must be at least  $\max(1, N \times (N + 1)/2)$ .  
*On entry:* the upper or lower triangle of the  $n$  by  $n$  symmetric matrix  $B$ , packed by columns.

More precisely,

if UPLO = 'U', the upper triangle of  $B$  must be stored with element  $B_{ij}$  in  $BP(i + j(j - 1)/2)$  for  $i \leq j$ ;

if UPLO = 'L', the lower triangle of  $B$  must be stored with element  $B_{ij}$  in  $BP(i + (2n - j)(j - 1)/2)$  for  $i \geq j$ .

*On exit:* the triangular factor  $U$  or  $L$  from the Cholesky factorization  $B = U^T U$  or  $B = LL^T$ , in the same storage format as  $B$ .

7: W(N) – REAL (KIND=nag\_wp) array *Output*

*On exit:* the eigenvalues in ascending order.

8: Z(LDZ,\*) – REAL (KIND=nag\_wp) array *Output*

**Note:** the second dimension of the array  $Z$  must be at least  $\max(1, N)$  if JOBZ = 'V', and at least 1 otherwise.

*On exit:* if JOBZ = 'V',  $Z$  contains the matrix  $Z$  of eigenvectors. The eigenvectors are normalized as follows:

if ITYPE = 1 or 2,  $Z^T B Z = I$ ;

if ITYPE = 3,  $Z^T B^{-1} Z = I$ .

If JOBZ = 'N',  $Z$  is not referenced.

9: LDZ – INTEGER *Input*

*On entry:* the first dimension of the array  $Z$  as declared in the (sub)program from which F08TCF (DSPGVD) is called.

*Constraints:*

if JOBZ = 'V',  $LDZ \geq \max(1, N)$ ;  
otherwise  $LDZ \geq 1$ .

10: WORK(max(1, LWORK)) – REAL (KIND=nag\_wp) array *Workspace*

*On exit:* if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimal performance.

11: LWORK – INTEGER *Input*

*On entry:* the dimension of the array WORK as declared in the (sub)program from which F08TCF (DSPGVD) is called.

If LWORK = -1, a workspace query is assumed; the routine only calculates the minimum sizes of the WORK and IWORK arrays, returns these values as the first entries of the WORK and IWORK arrays, and no error message related to LWORK or LIWORK is issued.

*Constraints:*

if  $N \leq 1$ , LWORK  $\geq 1$ ;

if JOBZ = 'N' and  $N > 1$ , LWORK  $\geq 2 \times N$ ;

if JOBZ = 'V' and  $N > 1$ , LWORK  $\geq 1 + 6 \times N + 2 \times N^2$ .

12: IWORK(max(1, LIWORK)) – INTEGER array *Workspace*

*On exit:* if INFO = 0, IWORK(1) returns the minimum LIWORK.

13: LIWORK – INTEGER *Input*

*On entry:* the dimension of the array IWORK as declared in the (sub)program from which F08TCF (DSPGVD) is called.

If  $LIWORK = -1$ , a workspace query is assumed; the routine only calculates the minimum sizes of the  $WORK$  and  $IWORK$  arrays, returns these values as the first entries of the  $WORK$  and  $IWORK$  arrays, and no error message related to  $LWORK$  or  $LIWORK$  is issued.

*Constraints:*

if  $JOBZ = 'N'$  or  $N \leq 1$ ,  $LIWORK \geq 1$ ;  
 if  $JOBZ = 'V'$  and  $N > 1$ ,  $LIWORK \geq 3 + 5 \times N$ .

14: INFO – INTEGER

*Output*

*On exit:* INFO = 0 unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If  $INFO = -i$ , argument  $i$  had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

F07GDF (DPPTRF) or F08GCF (DSPEVD) returned an error code:

$\leq N$  if  $INFO = i$ , F08GCF (DSPEVD) failed to converge;  $i$  off-diagonal elements of an intermediate tridiagonal form did not converge to zero;

$> N$  if  $INFO = N + i$ , for  $1 \leq i \leq N$ , then the leading minor of order  $i$  of  $B$  is not positive definite. The factorization of  $B$  could not be completed and no eigenvalues or eigenvectors were computed.

## 7 Accuracy

If  $B$  is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of  $B$  differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of  $B$  would suggest. See Section 4.10 of Anderson *et al.* (1999) for details of the error bounds.

The example program below illustrates the computation of approximate error bounds.

## 8 Further Comments

The total number of floating point operations is proportional to  $n^3$ .

The complex analogue of this routine is F08TQF (ZHPGVD).

## 9 Example

This example finds all the eigenvalues and eigenvectors of the generalized symmetric eigenproblem  $ABz = \lambda z$ , where

$$A = \begin{pmatrix} 0.24 & 0.39 & 0.42 & -0.16 \\ 0.39 & -0.11 & 0.79 & 0.63 \\ 0.42 & 0.79 & -0.25 & 0.48 \\ -0.16 & 0.63 & 0.48 & -0.03 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.09 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.09 & 0.34 & 1.18 \end{pmatrix},$$

together with an estimate of the condition number of  $B$ , and approximate error bounds for the computed eigenvalues and eigenvectors.

The example program for F08TAF (DSPGV) illustrates solving a generalized symmetric eigenproblem of the form  $Az = \lambda Bz$ .
