

NAG Library Routine Document

S30CAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

S30CAF computes the price of a binary or digital cash-or-nothing option.

2 Specification

```
SUBROUTINE S30CAF (CALPUT, M, N, X, S, K, T, SIGMA, R, Q, P, LDP, IFAIL)
INTEGER          M, N, LDP, IFAIL
REAL (KIND=nag_wp) X(M), S, K, T(N), SIGMA, R, Q, P(LDP,N)
CHARACTER(1)    CALPUT
```

3 Description

S30CAF computes the price of a binary or digital cash-or-nothing option which pays a fixed amount, K , at expiration if the option is in-the-money (see Section 2.4 in the S Chapter Introduction). For a strike price, X , underlying asset price, S , and time to expiry, T , the payoff is therefore K , if $S > X$ for a call or $S < X$ for a put. Nothing is paid out when this condition is not met.

The price of a call with volatility, σ , risk-free interest rate, r , and annualised dividend yield, q , is

$$P_{\text{call}} = Ke^{-rT}\Phi(d_2)$$

and for a put,

$$P_{\text{put}} = Ke^{-rT}\Phi(-d_2)$$

where Φ is the cumulative Normal distribution function,

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^x (-y^2/2) dy,$$

and

$$d_2 = \frac{\ln(S/X) + (r - q - \sigma^2/2)T}{\sigma\sqrt{T}}.$$

5 Parameters

1: CALPUT – CHARACTER(1)

Input

On entry: determines whether the option is a call or a put.

CALPUT = 'C'

A call. The holder has a right to buy.

CALPUT = 'P'

A put. The holder has a right to sell.

Constraint: CALPUT = 'C' or 'P'.

- 2: M – INTEGER *Input*
On entry: the number of strike prices to be used.
Constraint: $M \geq 1$.
- 3: N – INTEGER *Input*
On entry: the number of times to expiry to be used.
Constraint: $N \geq 1$.
- 4: X(M) – REAL (KIND=nag_wp) array *Input*
On entry: X(*i*) must contain X_i , the *i*th strike price, for $i = 1, 2, \dots, M$.
Constraint: $X(i) \geq z$ and $X(i) \leq 1/z$, where $z = X02AMF()$, the safe range parameter, for $i = 1, 2, \dots, M$.
- 5: S – REAL (KIND=nag_wp) *Input*
On entry: S, the price of the underlying asset.
Constraint: $S \geq z$ and $S \leq 1.0/z$, where $z = X02AMF()$, the safe range parameter.
- 6: K – REAL (KIND=nag_wp) *Input*
On entry: the amount, K, to be paid at expiration if the option is in-the-money, i.e., if $S > X(i)$ when CALPUT = 'C', or if $S < X(i)$ when CALPUT = 'P', for $i = 1, 2, \dots, m$.
Constraint: $K \geq 0.0$.
- 7: T(N) – REAL (KIND=nag_wp) array *Input*
On entry: T(*i*) must contain T_i , the *i*th time, in years, to expiry, for $i = 1, 2, \dots, N$.
Constraint: $T(i) \geq z$, where $z = X02AMF()$, the safe range parameter, for $i = 1, 2, \dots, N$.
- 8: SIGMA – REAL (KIND=nag_wp) *Input*
On entry: σ , the volatility of the underlying asset. Note that a rate of 15% should be entered as 0.15.
Constraint: SIGMA > 0.0.
- 9: R – REAL (KIND=nag_wp) *Input*
On entry: r, the annual risk-free interest rate, continuously compounded. Note that a rate of 5% should be entered as 0.05.
Constraint: $R \geq 0.0$.
- 10: Q – REAL (KIND=nag_wp) *Input*
On entry: q, the annual continuous yield rate. Note that a rate of 8% should be entered as 0.08.
Constraint: $Q \geq 0.0$.
- 11: P(LDP,N) – REAL (KIND=nag_wp) array *Output*
On exit: the leading $M \times N$ part of the array P contains the computed option prices.
- 12: LDP – INTEGER *Input*
On entry: the first dimension of the array P as declared in the (sub)program from which S30CAF is called.
Constraint: $LDP \geq M$.

13: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1 . If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0 . **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1 , explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, CALPUT \neq 'C' or 'P'.

IFAIL = 2

On entry, $M \leq 0$.

IFAIL = 3

On entry, $N \leq 0$.

IFAIL = 4

On entry, $X(i) < z$ or $X(i) > 1/z$, where $z = X02AMF()$, the safe range parameter.

IFAIL = 5

On entry, $S < z$ or $S > 1.0/z$, where $z = X02AMF()$, the safe range parameter.

IFAIL = 6

On entry, $K < 0.0$.

IFAIL = 7

On entry, $T(i) < z$, where $z = X02AMF()$, the safe range parameter.

IFAIL = 8

On entry, $SIGMA \leq 0.0$.

IFAIL = 9

On entry, $R < 0.0$.

IFAIL = 10

On entry, $Q < 0.0$.

IFAIL = 12

On entry, $LDP < M$.

7 Accuracy

The accuracy of the output is dependent on the accuracy of the cumulative Normal distribution function, Φ . This is evaluated using a rational Chebyshev expansion, chosen so that the maximum relative error in the expansion is of the order of the *machine precision* (see S15ABF and S15ADF). An accuracy close to *machine precision* can generally be expected.

8 Further Comments

None.

9 Example

This example computes the price of a cash-or-nothing put with a time to expiry of 0.75 years, a stock price of 100 and a strike price of 80. The risk-free interest rate is 6% per year and the volatility is 35% per year. If the option is in-the-money at expiration, i.e., if $S > X$, the payoff is 10.
