

NAG Library Routine Document

F01VGF (DTFTTR)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F01VGF (DTFTTR) unpacks a real triangular matrix stored in Rectangular Full Packed (RFP) format to full format in a two-dimensional array. The RFP storage format is described in Section 3.3.3 in the F07 Chapter Introduction.

2 Specification

```
SUBROUTINE F01VGF (TRANSR, UPLO, N, ARF, A, LDA, INFO)
INTEGER          N, LDA, INFO
REAL (KIND=nag_wp) ARF(N*(N+1)/2), A(LDA,*)
CHARACTER(1)    TRANSR, UPLO
```

The routine may be called by its LAPACK name *dtfttr*.

3 Description

F01VGF (DTFTTR) unpacks a real n by n triangular matrix A , stored in RFP format to conventional storage in a two-dimensional array. This routine is intended for possible use in conjunction with routines from Chapters F06 and F07 where some routines that use triangular matrices store them in RFP format.

4 References

None.

5 Parameters

- 1: TRANSR – CHARACTER(1) *Input*
On entry: specifies whether the RFP representation of A is normal or transposed.
 TRANSR = 'N'
 The matrix A is stored in normal RFP format.
 TRANSR = 'T'
 The matrix A is stored in transposed RFP format.
Constraint: TRANSR = 'N' or 'T'.
- 2: UPLO – CHARACTER(1) *Input*
On entry: specifies whether A is upper or lower triangular.
 UPLO = 'U'
 A is upper triangular.
 UPLO = 'L'
 A is lower triangular.
Constraint: UPLO = 'U' or 'L'.

- 3: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 4: ARF($N \times (N + 1)/2$) – REAL (KIND=nag_wp) array *Input*
On entry: the n by n triangular matrix A in RFP format, as described in Section 3.3.3 in the F07 Chapter Introduction.
- 5: A(LDA,*) – REAL (KIND=nag_wp) array *Output*
Note: the second dimension of the array A must be at least N .
On exit: the triangular matrix A .
 If UPLO = 'U', A is upper triangular and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', A is lower triangular and the elements of the array above the diagonal are not referenced.
- 6: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F01VGF (DTFTTR) is called.
Constraint: $LDA \geq \max(1, N)$.
- 7: INFO – INTEGER *Output*
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = $-i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

Not applicable.

8 Further Comments

None.

9 Example

This example reads in a triangular matrix in RFP format and unpacks it to full format.
