NAG Library Routine Document

F04AFF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F04AFF calculates the accurate solution of a set of real symmetric positive definite linear equations with multiple right-hand sides, $AX = B$, with iterative refinement, where A has been factorized by F03AEF.

2 Specification

```
SUBROUTINE F04AFF (N, IR, A, LDA, P, B, LDB, EPS, X, LDX, BB, LDBB, K,          &
                   IFAIL)

INTEGER           N, IR, LDA, LDB, LDX, LDBB, K, IFAIL
REAL (KIND=nag_wp) A(LDA,N), P(N), B(LDB,IR), EPS, X(LDX,IR), BB(LDBB,IR)
```

3 Description

To solve a set of real linear equations $AX = B$ where A is symmetric positive definite, F04AFF must be preceded by a call to F03AEF which computes a Cholesky factorization of A as $A = LL^{\mathrm{T}}$, where L is lower triangular. An approximation to X is then found by forward and backward substitution. The residual matrix $R = B - AX$ is then calculated using **additional precision**, and a correction D to X is found by solving $LL^{\mathrm{T}}D = R$. X is replaced by $X + D$, and this iterative refinement of the solution is repeated until full machine accuracy has been obtained.

5 Parameters

1:    N – INTEGER   *Input*

    On entry: n, the order of the matrix A.

    Constraint: N $\geq$ 0.

2:    IR – INTEGER   *Input*

    On entry: r, the number of right-hand sides.

3:    A(LDA,N) – REAL (KIND=nag_wp) array   *Input*

    On entry: the upper triangle of the n by n positive definite symmetric matrix A, and the subdiagonal elements of its Cholesky factor L, as returned by F03AEF.

    On exit: is used as internal workspace, but is restored on exit.

4:    LDA – INTEGER   *Input*

    On entry: the first dimension of the array A as declared in the (sub)program from which F04AFF is called.

    Constraint: LDA $\geq$ N.

5:    P(N) – REAL (KIND=nag_wp) array   *Input*

   On entry: the reciprocals of the diagonal elements of L, as returned by F03AEF.

6:    B(LDB,IR) – REAL (KIND=nag_wp) array   *Input*

   On entry: the n by r right-hand side matrix B.

7:    LDB – INTEGER   *Input*

   On entry: the first dimension of the array B as declared in the (sub)program from which F04AFF is called.

   Constraint: LDB $\geq$ N.

8:    EPS – REAL (KIND=nag_wp)   *Input*

   On entry: must be set to the value of the ***machine precision***.

9:    X(LDX,IR) – REAL (KIND=nag_wp) array   *Output*

   On exit: the n by r solution matrix X.

10:   LDX – INTEGER   *Input*

   On entry: the first dimension of the array X as declared in the (sub)program from which F04AFF is called.

   Constraint: LDX $\geq$ N.

11:   BB(LDBB,IR) – REAL (KIND=nag_wp) array   *Output*

   On exit: the final n by r residual matrix $R = B - AX$.

12:   LDBB – INTEGER   *Input*

   On entry: the first dimension of the array BB as declared in the (sub)program from which F04AFF is called.

   Constraint: LDBB $\geq$ N.

13:   K – INTEGER   *Output*

   On exit: the number of iterations needed in the refinement process.

14:   IFAIL – INTEGER   *Input/Output*

   On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

   For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. **When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.**

   On exit: IFAIL $= 0$ unless the routine detects an error or a warning has been flagged (see Section 6).

6   Error Indicators and Warnings

If on entry IFAIL = 0 or −1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

The matrix A is too ill-conditioned to produce a correctly rounded solution.

7   Accuracy

The computed solutions should be correct to full machine accuracy. For a detailed error analysis see page 39 of Wilkinson and Reinsch (1971).

8   Further Comments

The time taken by F04AFF is approximately proportional to $n^2 r$.

9   Example

This example solves the set of linear equations $AX = B$ where

$$A = \begin{pmatrix} 5 & 7 & 6 & 5 \\ 7 & 10 & 8 & 7 \\ 6 & 8 & 10 & 9 \\ 5 & 7 & 9 & 10 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 23 \\ 32 \\ 33 \\ 31 \end{pmatrix}.$$
