NAG Library Routine Document

F04MEF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F04MEF updates the solution to the Yule–Walker equations for a real symmetric positive definite Toeplitz system.

2 Specification

3 Description

F04MEF solves the equations

$$T_n x_n = -t_n,$$

where T_n is the n by n symmetric positive definite Toeplitz matrix

$$T_n = \begin{pmatrix} \tau_0 & \tau_1 & \tau_2 & \dots & \tau_{n-1} \\ \tau_1 & \tau_0 & \tau_1 & \dots & \tau_{n-2} \\ \tau_2 & \tau_1 & \tau_0 & \dots & \tau_{n-3} \\ \vdots & \vdots & \ddots & \vdots \\ \tau_{n-1} & \tau_{n-2} & \tau_{n-3} & \dots & \tau_0 \end{pmatrix}$$

and t_n is the vector

$$t_n^{\rm T}=(\tau_1\tau_2\ldots\tau_n),$$

given the solution of the equations

$$T_{n-1}x_{n-1} = -t_{n-1}.$$

The routine will normally be used to successively solve the equations

$$T_k x_k = -t_k, \qquad k = 1, 2, \dots, n.$$

If it is desired to solve the equations for a single value of n, then routine F04FEF may be called. This routine uses the method of Durbin (see Durbin (1960) and Golub and Van Loan (1996)).

F04MEF NAG Library Manual

5 Parameters

1: N – INTEGER Input

On entry: the order of the Toeplitz matrix T.

Constraint: $N \ge 0$. When N = 0, then an immediate return is effected.

2: T(0:N) - REAL (KIND=nag wp) array

Input

On entry: T(0) must contain the value τ_0 of the diagonal elements of T, and the remaining N elements of T must contain the elements of the vector t_n .

Constraint: T(0) > 0.0. Note that if this is not true, then the Toeplitz matrix cannot be positive definite.

3: $X(*) - REAL (KIND=nag_wp) array$

Input/Output

Note: the dimension of the array X must be at least max(1, N).

On entry: with N > 1 the (n - 1) elements of the solution vector x_{n-1} as returned by a previous call to F04MEF. The element X(N) need not be specified.

Constraint: |X(N-1)| < 1.0. Note that this is the partial (auto)correlation coefficient, or reflection coefficient, for the (n-1)th step. If the constraint does not hold, then T_n cannot be positive definite.

On exit: the solution vector x_n . The element X(N) returns the partial (auto)correlation coefficient, or reflection coefficient, for the nth step. If $|X(N)| \ge 1.0$, then the matrix T_{n+1} will not be positive definite to working accuracy.

4: V - REAL (KIND=nag wp)

Input/Output

On entry: with N > 1 the mean square prediction error for the (n-1)th step, as returned by a previous call to F04MEF.

On exit: the mean square prediction error, or predictor error variance ratio, ν_n , for the nth step. (See Section 8 and the Introduction to Chapter G13.)

5: WORK(N-1) - REAL (KIND=nag wp) array

Workspace

6: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

F04MEF.2 Mark 24

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = -1

$$\begin{array}{ll} \text{On entry,} & N<0,\\ \text{or} & T(0)\leq 0.0,\\ \text{or} & N>1 \text{ and } |X(N-1)|\geq 1.0. \end{array}$$

IFAIL = 1

The Toeplitz matrix T_{n+1} is not positive definite to working accuracy. If, on exit, X(N) is close to unity, then the principal minor was probably close to being singular, and the sequence $\tau_0, \tau_1, \ldots, \tau_N$ may be a valid sequence nevertheless. X returns the solution of the equations

$$T_n x_n = -t_n$$

and V returns v_n , but it may not be positive.

7 Accuracy

The computed solution of the equations certainly satisfies

$$r = T_n x_n + t_n,$$

where $||r||_1$ is approximately bounded by

$$||r||_1 \le c\epsilon \left(\prod_{i=1}^n (1+|p_i|)-1\right),$$

c being a modest function of n, ϵ being the *machine precision* and p_k being the kth element of x_k . This bound is almost certainly pessimistic, but it has not yet been established whether or not the method of Durbin is backward stable. For further information on stability issues see Bunch (1985), Bunch (1987), Cybenko (1980) and Golub and Van Loan (1996). The following bounds on $||T_n^{-1}||_1$ hold:

$$\max\left(\frac{1}{v_{n-1}}, \frac{1}{\prod\limits_{i=1}^{n-1}(1-p_i)}\right) \leq \left\|T_n^{-1}\right\|_1 \leq \prod_{i=1}^{n-1}\left(\frac{1+|p_i|}{1-|p_i|}\right),$$

where v_n is the mean square prediction error for the nth step. (See Cybenko (1980).) Note that $v_n < v_{n-1}$. The norm of T_n^{-1} may also be estimated using routine F04YDF.

8 Further Comments

The number of floating point operations used by this routine is approximately 4n.

The mean square prediction errors, v_i , is defined as

$$v_i = (\tau_0 + t_{i-1}^{\mathrm{T}} x_{i-1}) / \tau_0.$$

Note that $v_i = (1 - p_i^2)v_{i-1}$.

Mark 24 F04MEF.3

9 Example

This example finds the solution of the Yule-Walker equations $T_k x_k = -t_k$, k = 1, 2, 3, 4 where

$$T_4 = \begin{pmatrix} 4 & 3 & 2 & 1 \\ 3 & 4 & 3 & 2 \\ 2 & 3 & 4 & 3 \\ 1 & 2 & 3 & 4 \end{pmatrix}$$
 and $t_4 = \begin{pmatrix} 3 \\ 2 \\ 1 \\ 0 \end{pmatrix}$.
