

NAG Library Routine Document

F08KPF (ZGESVD)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08KPF (ZGESVD) computes the singular value decomposition (SVD) of a complex m by n matrix A , optionally computing the left and/or right singular vectors.

2 Specification

```

SUBROUTINE F08KPF (JOBU, JOBVT, M, N, A, LDA, S, U, LDU, VT, LDVT, WORK,          &
                  LWORK, RWORK, INFO)

INTEGER                M, N, LDA, LDU, LDVT, LWORK, INFO
REAL (KIND=nag_wp)    S(*), RWORK(*)
COMPLEX (KIND=nag_wp) A(LDA,*), U(LDU,*), VT(LDVT,*), WORK(max(1,LWORK))
CHARACTER(1)          JOBU, JOBVT

```

The routine may be called by its LAPACK name *zgesvd*.

3 Description

The SVD is written as

$$A = U\Sigma V^H,$$

where Σ is an m by n matrix which is zero except for its $\min(m, n)$ diagonal elements, U is an m by m unitary matrix, and V is an n by n unitary matrix. The diagonal elements of Σ are the singular values of A ; they are real and non-negative, and are returned in descending order. The first $\min(m, n)$ columns of U and V are the left and right singular vectors of A .

Note that the routine returns V^H , not V .

5 Parameters

1: JOBU – CHARACTER(1) *Input*

On entry: specifies options for computing all or part of the matrix U .

JOBU = 'A'

All m columns of U are returned in array U.

JOBU = 'S'

The first $\min(m, n)$ columns of U (the left singular vectors) are returned in the array U.

JOBU = 'O'

The first $\min(m, n)$ columns of U (the left singular vectors) are overwritten on the array A.

- JOBV = 'N'
 No columns of U (no left singular vectors) are computed.
Constraint: JOBV = 'A', 'S', 'O' or 'N'.
- 2: JOBVT – CHARACTER(1) *Input*
On entry: specifies options for computing all or part of the matrix V^H .
 JOBVT = 'A'
 All n rows of V^H are returned in the array VT.
 JOBVT = 'S'
 The first $\min(m, n)$ rows of V^H (the right singular vectors) are returned in the array VT.
 JOBVT = 'O'
 The first $\min(m, n)$ rows of V^H (the right singular vectors) are overwritten on the array A.
 JOBVT = 'N'
 No rows of V^H (no right singular vectors) are computed.
Constraints:
 JOBVT = 'A', 'S', 'O' or 'N';
 JOBVT and JOBV cannot both be 'O'.
- 3: M – INTEGER *Input*
On entry: m , the number of rows of the matrix A .
Constraint: $M \geq 0$.
- 4: N – INTEGER *Input*
On entry: n , the number of columns of the matrix A .
Constraint: $N \geq 0$.
- 5: A(LDA,*) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the m by n matrix A .
On exit: if JOBV = 'O', A is overwritten with the first $\min(m, n)$ columns of U (the left singular vectors, stored column-wise).
 If JOBVT = 'O', A is overwritten with the first $\min(m, n)$ rows of V^H (the right singular vectors, stored row-wise).
 If JOBV \neq 'O' and JOBVT \neq 'O', the contents of A are destroyed.
- 6: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08KPF (ZGESVD) is called.
Constraint: $LDA \geq \max(1, M)$.
- 7: S(*) – REAL (KIND=nag_wp) array *Output*
Note: the dimension of the array S must be at least $\max(1, \min(M, N))$.
On exit: the singular values of A , sorted so that $S(i) \geq S(i + 1)$.

- 8: U(LDU,*) – COMPLEX (KIND=nag_wp) array *Output*
Note: the second dimension of the array U must be at least $\max(1, M)$ if $\text{JOB} = 'A'$, $\max(1, \min(M, N))$ if $\text{JOB} = 'S'$, and at least 1 otherwise.
On exit: if $\text{JOB} = 'A'$, U contains the m by m unitary matrix U .
 If $\text{JOB} = 'S'$, U contains the first $\min(m, n)$ columns of U (the left singular vectors, stored column-wise).
 If $\text{JOB} = 'N'$ or $'O'$, U is not referenced.
- 9: LDU – INTEGER *Input*
On entry: the first dimension of the array U as declared in the (sub)program from which F08KPF (ZGESVD) is called.
Constraints:
 if $\text{JOB} = 'A'$ or $'S'$, $\text{LDU} \geq \max(1, M)$;
 otherwise $\text{LDU} \geq 1$.
- 10: VT(LDVT,*) – COMPLEX (KIND=nag_wp) array *Output*
Note: the second dimension of the array VT must be at least $\max(1, N)$ if $\text{JOB} = 'A'$ or $'S'$, and at least 1 otherwise.
On exit: if $\text{JOB} = 'A'$, VT contains the n by n unitary matrix V^H .
 If $\text{JOB} = 'S'$, VT contains the first $\min(m, n)$ rows of V^H (the right singular vectors, stored row-wise).
 If $\text{JOB} = 'N'$ or $'O'$, VT is not referenced.
- 11: LDVT – INTEGER *Input*
On entry: the first dimension of the array VT as declared in the (sub)program from which F08KPF (ZGESVD) is called.
Constraints:
 if $\text{JOB} = 'A'$, $\text{LDVT} \geq \max(1, N)$;
 if $\text{JOB} = 'S'$, $\text{LDVT} \geq \max(1, \min(M, N))$;
 otherwise $\text{LDVT} \geq 1$.
- 12: WORK(max(1, LWORK)) – COMPLEX (KIND=nag_wp) array *Workspace*
On exit: if $\text{INFO} = 0$, the real part of $\text{WORK}(1)$ contains the minimum value of LWORK required for optimal performance.
- 13: LWORK – INTEGER *Input*
On entry: the dimension of the array WORK as declared in the (sub)program from which F08KPF (ZGESVD) is called.
 If $\text{LWORK} = -1$, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.
Suggested value: for optimal performance, LWORK should generally be larger. Consider increasing LWORK by at least $nb \times \min(M, N)$, where nb is the optimal **block size**.
Constraint: $\text{LWORK} \geq \max(1, 2 \times \min(M, N) + \max(M, N))$.

14: RWORK(*) – REAL (KIND=nag_wp) array Workspace

Note: the dimension of the array RWORK must be at least $\max(1, 5 \times \min(M, N))$.

On exit: if $\text{INFO} > 0$, RWORK(1 : $\min(M, N) - 1$) contains the unconverged superdiagonal elements of an upper bidiagonal matrix B whose diagonal is in S (not necessarily sorted). B satisfies $A = UB V^H$, so it has the same singular values as A , and singular vectors related by U and V^H .

15: INFO – INTEGER Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If $\text{INFO} = -i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

If F08KPF (ZGESVD) did not converge, INFO specifies how many superdiagonals of an intermediate bidiagonal form did not converge to zero. See the description of RWORK above for details.

7 Accuracy

The computed singular value decomposition is nearly the exact singular value decomposition for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the *machine precision*. In addition, the computed singular vectors are nearly orthogonal to working precision. See Section 4.9 of Anderson *et al.* (1999) for further details.

8 Further Comments

The total number of floating point operations is approximately proportional to mn^2 when $m > n$ and m^2n otherwise.

The singular values are returned in descending order.

The real analogue of this routine is F08KBF (DGESVD).

9 Example

This example finds the singular values and left and right singular vectors of the 6 by 4 matrix

$$A = \begin{pmatrix} 0.96 - 0.81i & -0.03 + 0.96i & -0.91 + 2.06i & -0.05 + 0.41i \\ -0.98 + 1.98i & -1.20 + 0.19i & -0.66 + 0.42i & -0.81 + 0.56i \\ 0.62 - 0.46i & 1.01 + 0.02i & 0.63 - 0.17i & -1.11 + 0.60i \\ -0.37 + 0.38i & 0.19 - 0.54i & -0.98 - 0.36i & 0.22 - 0.20i \\ 0.83 + 0.51i & 0.20 + 0.01i & -0.17 - 0.46i & 1.47 + 1.59i \\ 1.08 - 0.28i & 0.20 - 0.12i & -0.07 + 1.23i & 0.26 + 0.26i \end{pmatrix},$$

together with approximate error bounds for the computed singular values and vectors.

The example program for F08KRF (ZGESDD) illustrates finding a singular value decomposition for the case $m \leq n$.
