

NAG Library Routine Document

F01VFF (ZTRTTF)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F01VFF (ZTRTTF) copies a complex triangular matrix, stored in a full format array, to a Rectangular Full Packed (RFP) format array.

2 Specification

```
SUBROUTINE F01VFF (TRANSR, UPLO, N, A, LDA, AR, INFO)
  INTEGER          N, LDA, INFO
  COMPLEX (KIND=nag_wp) A(LDA,*), AR(N*(N+1)/2)
  CHARACTER(1)    TRANSR, UPLO
```

The routine may be called by its LAPACK name *ztrtf*.

3 Description

F01VFF (ZTRTTF) packs a complex n by n triangular matrix A , stored conventionally in a full format array, into RFP format. This routine is intended for possible use in conjunction with routines from Chapters F06, F07 and F16 where some routines that use triangular matrices store them in RFP format. The RFP storage format is described in Section 3.3.3 in the F07 Chapter Introduction.

4 References

5 Parameters

1: TRANSR – CHARACTER(1) *Input*

On entry: specifies whether the normal RFP representation of A or its conjugate transpose is stored.

TRANSR = 'N'

The RFP representation of the matrix A is stored.

TRANSR = 'C'

The conjugate transpose of the RFP representation of the matrix A is stored.

Constraint: TRANSR = 'N' or 'C'.

2: UPLO – CHARACTER(1) *Input*

On entry: specifies whether A is upper or lower triangular.

UPLO = 'U'

A is upper triangular.

UPLO = 'L'

A is lower triangular.

Constraint: UPLO = 'U' or 'L'.

- 3: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 4: A(LDA,*) – COMPLEX (KIND=nag_wp) array *Input*
Note: the second dimension of the array A must be at least N .
On entry: the triangular matrix A .
 If UPLO = 'U', A is upper triangular and the elements of the array below the diagonal are not referenced.
 If UPLO = 'L', A is lower triangular and the elements of the array above the diagonal are not referenced.
- 5: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F01VFF (ZTRTTF) is called.
Constraint: $LDA \geq \max(1, N)$.
- 6: AR($N \times (N + 1)/2$) – COMPLEX (KIND=nag_wp) array *Output*
On exit: the upper or lower n by n triangular matrix A (as specified by UPLO) in either normal or transposed RFP format (as specified by TRANSR). The storage format is described in Section 3.3.3 in the F07 Chapter Introduction.
- 7: INFO – INTEGER *Output*
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = $-i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

Not applicable.

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

This example reads in a triangular matrix and copies it to RFP format.
