

NAG Library Routine Document

F07FFF (DPOEQU)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F07FFF (DPOEQU) computes a diagonal scaling matrix S intended to equilibrate a real n by n symmetric positive definite matrix A and reduce its condition number.

2 Specification

```
SUBROUTINE F07FFF (N, A, LDA, S, SCOND, AMAX, INFO)
  INTEGER          N, LDA, INFO
  REAL (KIND=nag_wp) A(LDA,*), S(N), SCOND, AMAX
```

The routine may be called by its LAPACK name *dpoequ*.

3 Description

F07FFF (DPOEQU) computes a diagonal scaling matrix S chosen so that

$$s_j = 1/\sqrt{a_{jj}}.$$

This means that the matrix B given by

$$B = SAS,$$

has diagonal elements equal to unity. This in turn means that the condition number of B , $\kappa_2(B)$, is within a factor n of the matrix of smallest possible condition number over all possible choices of diagonal scalings (see Corollary 7.6 of Higham (2002)).

4 References

Higham N J (2002) *Accuracy and Stability of Numerical Algorithms* (2nd Edition) SIAM, Philadelphia

5 Parameters

- 1: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 2: A(LDA,*) – REAL (KIND=nag_wp) array *Input*
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the matrix A whose scaling factors are to be computed. Only the diagonal elements of the array A are referenced.
- 3: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F07FFF (DPOEQU) is called.
Constraint: $LDA \geq \max(1, N)$.

- 4: S(N) – REAL (KIND=nag_wp) array Output
On exit: if INFO = 0, S contains the diagonal elements of the scaling matrix *S*.
- 5: SCOND – REAL (KIND=nag_wp) Output
On exit: if INFO = 0, SCOND contains the ratio of the smallest value of S to the largest value of S. If SCOND ≥ 0.1 and AMAX is neither too large nor too small, it is not worth scaling by *S*.
- 6: AMAX – REAL (KIND=nag_wp) Output
On exit: $\max |a_{ij}|$. If AMAX is very close to overflow or underflow, the matrix *A* should be scaled.
- 7: INFO – INTEGER Output
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = $-i$, argument *i* had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

The *value*th diagonal element of *A* is not positive (and hence *A* cannot be positive definite).

7 Accuracy

The computed scale factors will be close to the exact scale factors.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The complex analogue of this routine is F07FTF (ZPOEQU).

10 Example

This example equilibrates the symmetric positive definite matrix *A* given by

$$A = \begin{pmatrix} 4.16 & -3.12 \times 10^5 & 0.56 & -0.10 \\ -3.12 \times 10^5 & 5.03 \times 10^{10} & -0.83 \times 10^5 & 1.18 \times 10^5 \\ 0.56 & -0.83 \times 10^5 & 0.76 & 0.34 \\ -0.10 & 1.18 \times 10^5 & 0.34 & 1.18 \end{pmatrix}.$$

Details of the scaling factors and the scaled matrix are output.
