

# NAG Library Routine Document

## **F07GTF (ZPPEQU)**

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

F07GTF (ZPPEQU) computes a diagonal scaling matrix  $S$  intended to equilibrate a complex  $n$  by  $n$  Hermitian positive definite matrix  $A$ , stored in packed format, and reduce its condition number.

### 2 Specification

```
SUBROUTINE F07GTF (UPLO, N, AP, S, SCOND, AMAX, INFO)
INTEGER           N, INFO
REAL (KIND=nag_wp) S(N), SCOND, AMAX
COMPLEX (KIND=nag_wp) AP(*)
CHARACTER(1)      UPLO
```

The routine may be called by its LAPACK name ***zppequ***.

### 3 Description

F07GTF (ZPPEQU) computes a diagonal scaling matrix  $S$  chosen so that

$$s_j = 1/\sqrt{a_{jj}}.$$

This means that the matrix  $B$  given by

$$B = SAS,$$

has diagonal elements equal to unity. This in turn means that the condition number of  $B$ ,  $\kappa_2(B)$ , is within a factor  $n$  of the matrix of smallest possible condition number over all possible choices of diagonal scalings (see Corollary 7.6 of Higham (2002)).

### 4 References

Higham N J (2002) *Accuracy and Stability of Numerical Algorithms* (2nd Edition) SIAM, Philadelphia

### 5 Parameters

- |   |              |
|---|--------------|
| 1: UPLO – CHARACTER(1)  | <i>Input</i> |
| <p><i>On entry:</i> indicates whether the upper or lower triangular part of <math>A</math> is stored in the array AP, as follows:</p> <ul style="list-style-type: none"> <li>UPLO = 'U'<br/>The upper triangle of <math>A</math> is stored.</li> <li>UPLO = 'L'<br/>The lower triangle of <math>A</math> is stored.</li> </ul> <p><i>Constraint:</i> UPLO = 'U' or 'L'.</p> |              |
| 2: N – INTEGER  | <i>Input</i> |
| <p><i>On entry:</i> <math>n</math>, the order of the matrix <math>A</math>.</p> <p><i>Constraint:</i> <math>N \geq 0</math>.</p>  |              |

3: AP(\*) – COMPLEX (KIND=nag\_wp) array *Input*

**Note:** the dimension of the array AP must be at least  $\max(1, N \times (N + 1)/2)$ .

*On entry:* the  $n$  by  $n$  Hermitian matrix  $A$ , packed by columns.

More precisely,

if  $\text{UPLO} = \text{'U'}$ , the upper triangle of  $A$  must be stored with element  $A_{ij}$  in  $\text{AP}(i + j(j - 1)/2)$  for  $i \leq j$ ;

if  $\text{UPLO} = \text{'L'}$ , the lower triangle of  $A$  must be stored with element  $A_{ij}$  in  $\text{AP}(i + (2n - j)(j - 1)/2)$  for  $i \geq j$ .

Only the elements of AP corresponding to the diagonal elements  $A$  are referenced.

4: S(N) – REAL (KIND=nag\_wp) array *Output*

*On exit:* if  $\text{INFO} = 0$ , S contains the diagonal elements of the scaling matrix  $S$ .

5: SCOND – REAL (KIND=nag\_wp) *Output*

*On exit:* if  $\text{INFO} = 0$ , SCOND contains the ratio of the smallest value of S to the largest value of S. If SCOND  $\geq 0.1$  and AMAX is neither too large nor too small, it is not worth scaling by  $S$ .

6: AMAX – REAL (KIND=nag\_wp) *Output*

*On exit:*  $\max |a_{ij}|$ . If AMAX is very close to overflow or underflow, the matrix  $A$  should be scaled.

7: INFO – INTEGER *Output*

*On exit:*  $\text{INFO} = 0$  unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

$\text{INFO} < 0$

If  $\text{INFO} = -i$ , argument  $i$  had an illegal value. An explanatory message is output, and execution of the program is terminated.

$\text{INFO} > 0$

The  $\langle \text{value} \rangle$ th diagonal element of  $A$  is not positive (and hence  $A$  cannot be positive definite).

## 7 Accuracy

The computed scale factors will be close to the exact scale factors.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

The real analogue of this routine is F07GFF (DPPEQU).

## 10 Example

This example equilibrates the Hermitian positive definite matrix  $A$  given by

$$A = \begin{pmatrix} 3.23 & 1.51 - 1.92i & (1.90 + 0.84i) \times 10^5 & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 & (-0.23 + 1.11i) \times 10^5 & -1.18 + 1.37i \\ (1.90 - 0.84i) \times 10^5 & (-0.23 - 1.11i) \times 10^5 & 4.09 \times 10^{10} & (2.33 - 0.14i) \times 10^5 \\ 0.42 - 2.50i & -1.18 - 1.37i & (2.33 + 0.14i) \times 10^5 & 4.29 \end{pmatrix}.$$

Details of the scaling factors and the scaled matrix are output.
