NAG Library Routine Document F08SBF (DSYGVX)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08SBF (DSYGVX) computes selected eigenvalues and, optionally, eigenvectors of a real generalized symmetric-definite eigenproblem, of the form

$$Az = \lambda Bz$$
, $ABz = \lambda z$ or $BAz = \lambda z$,

where A and B are symmetric and B is also positive definite. Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

2 Specification

```
SUBROUTINE FO8SBF (ITYPE, JOBZ, RANGE, UPLO, N, A, LDA, B, LDB, VL, VU, & IL, IU, ABSTOL, M, W, Z, LDZ, WORK, LWORK, IWORK, JFAIL, INFO)

INTEGER ITYPE, N, LDA, LDB, IL, IU, M, LDZ, LWORK, WORK(5*N), JFAIL(*), INFO

REAL (KIND=nag_wp) A(LDA,*), B(LDB,*), VL, VU, ABSTOL, W(N), Z(LDZ,*), WORK(max(1,LWORK))

CHARACTER(1) JOBZ, RANGE, UPLO
```

The routine may be called by its LAPACK name dsygvx.

3 Description

F08SBF (DSYGVX) first performs a Cholesky factorization of the matrix B as $B = U^{\rm T}U$, when UPLO = 'U' or $B = LL^{\rm T}$, when UPLO = 'L'. The generalized problem is then reduced to a standard symmetric eigenvalue problem

$$Cx = \lambda x$$
,

which is solved for the desired eigenvalues and eigenvectors; the eigenvectors are then backtransformed to give the eigenvectors of the original problem.

For the problem $Az = \lambda Bz$, the eigenvectors are normalized so that the matrix of eigenvectors, Z, satisfies

$$Z^{\mathsf{T}}AZ = \Lambda$$
 and $Z^{\mathsf{T}}BZ = I$,

where Λ is the diagonal matrix whose diagonal elements are the eigenvalues. For the problem $ABz = \lambda z$ we correspondingly have

$$Z^{-1}AZ^{-T} = \Lambda$$
 and $Z^{T}BZ = I$,

and for $BAz = \lambda z$ we have

$$Z^{\mathsf{T}}AZ = \Lambda$$
 and $Z^{\mathsf{T}}B^{-1}Z = I$.

5 Parameters

1: ITYPE - INTEGER

Input

On entry: specifies the problem type to be solved.

ITYPE = 1

 $Az = \lambda Bz$.

ITYPE = 2

 $ABz = \lambda z$.

ITYPE = 3

 $BAz = \lambda z$.

Constraint: ITYPE = 1, 2 or 3.

2: JOBZ – CHARACTER(1)

Input

On entry: indicates whether eigenvectors are computed.

JOBZ = 'N'

Only eigenvalues are computed.

JOBZ = 'V'

Eigenvalues and eigenvectors are computed.

Constraint: JOBZ = 'N' or 'V'.

3: RANGE - CHARACTER(1)

Input

On entry: if RANGE = 'A', all eigenvalues will be found.

If RANGE = 'V', all eigenvalues in the half-open interval (VL, VU) will be found.

If RANGE = 'I', the ILth to IUth eigenvalues will be found.

Constraint: RANGE = 'A', 'V' or 'I'.

4: UPLO - CHARACTER(1)

Input

On entry: if UPLO = 'U', the upper triangles of A and B are stored.

If UPLO = 'L', the lower triangles of A and B are stored.

Constraint: UPLO = 'U' or 'L'.

5: N – INTEGER

Input

On entry: n, the order of the matrices A and B.

Constraint: $N \ge 0$.

F08SBF.2 Mark 25

6: $A(LDA, *) - REAL (KIND=nag_wp) array$

Input/Output

Note: the second dimension of the array A must be at least max(1, N).

On entry: the n by n symmetric matrix A.

If UPLO = 'U', the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.

If UPLO = 'L', the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

On exit: the lower triangle (if UPLO = 'L') or the upper triangle (if UPLO = 'U') of A, including the diagonal, is overwritten.

7: LDA – INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08SBF (DSYGVX) is called.

Constraint: LDA $\geq \max(1, N)$.

8: B(LDB,*) - REAL (KIND=nag_wp) array

Input/Output

Note: the second dimension of the array B must be at least max(1, N).

On entry: the n by n symmetric matrix B.

If UPLO = 'U', the upper triangular part of B must be stored and the elements of the array below the diagonal are not referenced.

If UPLO = 'L', the lower triangular part of B must be stored and the elements of the array above the diagonal are not referenced.

On exit: the triangular factor U or L from the Cholesky factorization $B = U^{T}U$ or $B = LL^{T}$.

9: LDB – INTEGER

Input

On entry: the first dimension of the array B as declared in the (sub)program from which F08SBF (DSYGVX) is called.

Constraint: LDB $\geq \max(1, N)$.

10: VL - REAL (KIND=nag_wp)

Input

11: VU - REAL (KIND=nag wp)

Input

On entry: if RANGE = 'V', the lower and upper bounds of the interval to be searched for eigenvalues.

If RANGE = 'A' or 'I', VL and VU are not referenced.

Constraint: if RANGE = 'V', VL < VU.

12: IL - INTEGER

Input

13: IU – INTEGER

Input

On entry: if RANGE = 'I', the indices (in ascending order) of the smallest and largest eigenvalues to be returned.

If RANGE = 'A' or 'V', IL and IU are not referenced.

Constraints:

```
\begin{array}{l} if \ RANGE='I' \ and \ N=0, \ IL=1 \ and \ IU=0; \\ if \ RANGE='I' \ and \ N>0, \ 1\leq IL\leq IU\leq N. \end{array}
```

14: ABSTOL – REAL (KIND=nag wp)

Input

On entry: the absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval [a, b] of width less than or equal to

$$ABSTOL + \epsilon \max(|a|, |b|),$$

where ϵ is the *machine precision*. If ABSTOL is less than or equal to zero, then $\epsilon \|T\|_1$ will be used in its place, where T is the tridiagonal matrix obtained by reducing C to tridiagonal form. Eigenvalues will be computed most accurately when ABSTOL is set to twice the underflow threshold $2 \times \text{X02AMF}(\)$, not zero. If this routine returns with INFO = 1 to N, indicating that some eigenvectors did not converge, try setting ABSTOL to $2 \times \text{X02AMF}(\)$. See Demmel and Kahan (1990).

15: M – INTEGER Output

On exit: the total number of eigenvalues found. $0 \le M \le N$.

If RANGE = 'A', M = N.

If RANGE = II', M = IU - IL + 1.

16: W(N) - REAL (KIND=nag wp) array

Output

On exit: the first M elements contain the selected eigenvalues in ascending order.

17: Z(LDZ,*) - REAL (KIND=nag wp) array

Output

Note: the second dimension of the array Z must be at least max(1, M) if JOBZ = 'V', and at least 1 otherwise.

On exit: if JOBZ = 'V', then

if INFO = 0, the first M columns of Z contain the orthonormal eigenvectors of the matrix A corresponding to the selected eigenvalues, with the ith column of Z holding the eigenvector associated with W(i). The eigenvectors are normalized as follows:

if ITYPE = 1 or 2,
$$Z^TBZ = I$$
;
if ITYPE = 3, $Z^TB^{-1}Z = I$;

if an eigenvector fails to converge (INFO = 1 to N), then that column of Z contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in JFAIL.

If JOBZ = 'N', Z is not referenced.

Note: you must ensure that at least max(1, M) columns are supplied in the array Z; if RANGE = 'V', the exact value of M is not known in advance and an upper bound of at least N must be used.

18: LDZ – INTEGER Input

On entry: the first dimension of the array Z as declared in the (sub)program from which F08SBF (DSYGVX) is called.

Constraints:

if
$$JOBZ = 'V', \ LDZ \ge max(1, N);$$
 otherwise $LDZ \ge 1.$

19: WORK(max(1, LWORK)) - REAL (KIND=nag wp) array

Workspace

On exit: if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimal performance.

F08SBF.4 Mark 25

20: LWORK – INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08SBF (DSYGVX) is called.

If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.

Suggested value: for optimal performance, LWORK $\geq (nb+3) \times N$, where nb is the optimal **block size** for F08FEF (DSYTRD).

Constraint: LWORK $\geq \max(1, 8 \times N)$.

21: $IWORK(5 \times N) - INTEGER$ array

Workspace

22: JFAIL(*) – INTEGER array

Output

Note: the dimension of the array JFAIL must be at least max(1, N).

On exit: if JOBZ = 'V', then

if INFO = 0, the first M elements of JFAIL are zero;

if INFO = 1 to N, JFAIL contains the indices of the eigenvectors that failed to converge.

If JOBZ = 'N', JFAIL is not referenced.

23: INFO - INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

If INFO = i, F08FBF (DSYEVX) failed to converge; i eigenvectors failed to converge. Their indices are stored in array JFAIL.

INFO > N

F07FDF (DPOTRF) returned an error code; i.e., if INFO = N + i, for $1 \le i \le N$, then the leading minor of order i of B is not positive definite. The factorization of B could not be completed and no eigenvalues or eigenvectors were computed.

7 Accuracy

If B is ill-conditioned with respect to inversion, then the error bounds for the computed eigenvalues and vectors may be large, although when the diagonal elements of B differ widely in magnitude the eigenvalues and eigenvectors may be less sensitive than the condition of B would suggest. See Section 4.10 of Anderson *et al.* (1999) for details of the error bounds.

8 Parallelism and Performance

F08SBF (DSYGVX) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08SBF NAG Library Manual

F08SBF (DSYGVX) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is proportional to n^3 .

The complex analogue of this routine is F08SPF (ZHEGVX).

10 Example

This example finds the eigenvalues in the half-open interval (-1.0, 1.0], and corresponding eigenvectors, of the generalized symmetric eigenproblem $Az = \lambda Bz$, where

$$A = \begin{pmatrix} 0.24 & 0.39 & 0.42 & -0.16 \\ 0.39 & -0.11 & 0.79 & 0.63 \\ 0.42 & 0.79 & -0.25 & 0.48 \\ -0.16 & 0.63 & 0.48 & -0.03 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 4.16 & -3.12 & 0.56 & -0.10 \\ -3.12 & 5.03 & -0.83 & 1.09 \\ 0.56 & -0.83 & 0.76 & 0.34 \\ -0.10 & 1.09 & 0.34 & 1.18 \end{pmatrix}$$

The example program for F08SCF (DSYGVD) illustrates solving a generalized symmetric eigenproblem of the form $ABz = \lambda z$.
