# **NAG Library Routine Document**

# G07CAF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

## 1 Purpose

G07CAF computes a *t*-test statistic to test for a difference in means between two Normal populations, together with a confidence interval for the difference between the means.

# 2 Specification

# 3 Description

Consider two independent samples, denoted by X and Y, of size  $n_x$  and  $n_y$  drawn from two Normal populations with means  $\mu_x$  and  $\mu_y$ , and variances  $\sigma_x^2$  and  $\sigma_y^2$  respectively. Denote the sample means by  $\bar{x}$  and  $\bar{y}$  and the sample variances by  $s_x^2$  and  $s_y^2$  respectively.

G07CAF calculates a test statistic and its significance level to test the null hypothesis  $H_0: \mu_x = \mu_y$ , together with upper and lower confidence limits for  $\mu_x - \mu_y$ . The test used depends on whether or not the two population variances are assumed to be equal.

1. It is assumed that the two variances are equal, that is  $\sigma_x^2 = \sigma_y^2$ 

The test used is the two sample t-test. The test statistic t is defined by;

$$t_{\text{obs}} = \frac{\bar{x} - \bar{y}}{s\sqrt{(1/n_x) + (1/n_y)}}$$

where

$$s^{2} = \frac{(n_{x} - 1)s_{x}^{2} + (n_{y} - 1)s_{y}^{2}}{n_{x} + n_{y} - 2}$$

is the pooled variance of the two samples.

Under the null hypothesis  $H_0$  this test statistic has a t-distribution with  $(n_x + n_y - 2)$  degrees of freedom.

The test of  $H_0$  is carried out against one of three possible alternatives;

 $H_1: \mu_x \neq \mu_y$ ; the significance level,  $p = P(t \geq |t_{\rm obs}|)$ , i.e., a two tailed probability.

 $H_1: \mu_x > \mu_y$ ; the significance level,  $p = P(t \ge t_{\text{obs}})$ , i.e., an upper tail probability.

 $H_1: \mu_x < \mu_y$ ; the significance level,  $p = P(t \le t_{\text{obs}})$ , i.e., a lower tail probability.

Upper and lower  $100(1-\alpha)\%$  confidence limits for  $\mu_x - \mu_y$  are calculated as:

$$(\bar{x} - \bar{y}) \pm t_{1-\alpha/2} s \sqrt{(1/n_x) + (1/n_y)}.$$

Mark 25 G07CAF.1

G07CAF NAG Library Manual

where  $t_{1-\alpha/2}$  is the  $100(1-\alpha/2)$  percentage point of the t-distribution with  $(n_x+n_y-2)$  degrees of freedom

2. It is not assumed that the two variances are equal.

If the population variances are not equal the usual two sample t-statistic no longer has a t-distribution and an approximate test is used.

This problem is often referred to as the Behrens-Fisher problem, see Kendall and Stuart (1969). The test used here is based on Satterthwaites procedure. To test the null hypothesis the test statistic t' is used where

$$t'_{\text{obs}} = \frac{\bar{x} - \bar{y}}{\text{se}(\bar{x} - \bar{y})}$$

where 
$$\operatorname{se}(\bar{x} - \bar{y}) = \sqrt{\frac{s_x^2}{n_x} + \frac{s_y^2}{n_y}}$$
.

A t-distribution with f degrees of freedom is used to approximate the distribution of t' where

$$f = \frac{\sec(\bar{x} - \bar{y})^4}{\frac{(s_x^2/n_x)^2}{(n_x - 1)} + \frac{(s_y^2/n_y)^2}{(n_y - 1)}}.$$

The test of  $H_0$  is carried out against one of the three alternative hypotheses described above, replacing t by t' and  $t_{obs}$  by  $t'_{obs}$ .

Upper and lower  $100(1-\alpha)\%$  confidence limits for  $\mu_x - \mu_y$  are calculated as:

$$(\bar{x} - \bar{y}) \pm t_{1-\alpha/2} \operatorname{se}(x - \bar{y}).$$

where  $t_{1-\alpha/2}$  is the  $100(1-\alpha/2)$  percentage point of the t-distribution with f degrees of freedom.

# 5 Parameters

## 1: TAIL – CHARACTER(1)

Input

On entry: indicates which tail probability is to be calculated, and thus which alternative hypothesis is to be used.

$$TAIL = 'T'$$

The two tail probability, i.e.,  $H_1: \mu_x \neq \mu_y$ .

$$TAIL = 'U'$$

The upper tail probability, i.e.,  $H_1: \mu_x > \mu_y$ .

$$TAIL = 'L'$$

The lower tail probability, i.e.,  $H_1: \mu_x < \mu_y$ .

Constraint: TAIL = 'T', 'U' or 'L'.

#### 2: EQUAL – CHARACTER(1)

Input

On entry: indicates whether the population variances are assumed to be equal or not.

$$EQUAL = 'E'$$

The population variances are assumed to be equal, that is  $\sigma_x^2 = \sigma_y^2$ .

G07CAF.2 Mark 25

EQUAL = 'U'

The population variances are not assumed to be equal.

*Constraint*: EQUAL = 'E' or 'U'.

#### 3: NX – INTEGER

Input

On entry:  $n_x$ , the size of the X sample.

*Constraint*:  $NX \ge 2$ .

#### 4: NY – INTEGER

Input

On entry:  $n_y$ , the size of the Y sample.

Constraint:  $NY \geq 2$ .

#### 5: XMEAN - REAL (KIND=nag wp)

Input

On entry:  $\bar{x}$ , the mean of the X sample.

#### 6: YMEAN - REAL (KIND=nag wp)

Input

On entry:  $\bar{y}$ , the mean of the Y sample.

#### 7: XSTD - REAL (KIND=nag wp)

Input

On entry:  $s_x$ , the standard deviation of the X sample.

Constraint: XSTD > 0.0.

#### 8: YSTD - REAL (KIND=nag\_wp)

Input

On entry:  $s_y$ , the standard deviation of the Y sample.

Constraint: YSTD > 0.0.

#### 9: CLEVEL – REAL (KIND=nag wp)

Input

On entry: the confidence level,  $1-\alpha$ , for the specified tail. For example CLEVEL = 0.95 will give a 95% confidence interval.

Constraint: 0.0 < CLEVEL < 1.0.

#### 10: T - REAL (KIND=nag wp)

Output

On exit: contains the test statistic,  $t_{obs}$  or  $t'_{obs}$ .

## 11: DF - REAL (KIND=nag wp)

Output

On exit: contains the degrees of freedom for the test statistic.

## 12: PROB - REAL (KIND=nag\_wp)

Output

On exit: contains the significance level, that is the tail probability, p, as defined by TAIL.

## 13: DL - REAL (KIND=nag\_wp)

Output

On exit: contains the lower confidence limit for  $\mu_x - \mu_y$ .

#### 14: DU – REAL (KIND=nag\_wp)

Output

On exit: contains the upper confidence limit for  $\mu_x - \mu_y$ .

Mark 25 G07CAF.3

G07CAF NAG Library Manual

#### 15: IFAIL - INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

```
IFAIL = 1
```

```
On entry, TAIL \neq 'T', 'U' or 'L', or EQUAL \neq 'E' or 'U', or NX < 2, or NY < 2, or XSTD \leq 0.0, or YSTD \leq 0.0, or CLEVEL \leq 0.0, or CLEVEL \geq 1.0.
```

$$IFAIL = -99$$

An unexpected error has been triggered by this routine. Please contact NAG.

See Section 3.8 in the Essential Introduction for further information.

```
IFAIL = -399
```

Your licence key may have expired or may not have been installed correctly.

See Section 3.7 in the Essential Introduction for further information.

```
IFAIL = -999
```

Dynamic memory allocation failed.

See Section 3.6 in the Essential Introduction for further information.

# 7 Accuracy

The computed probability and the confidence limits should be accurate to approximately five significant figures.

# 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

The sample means and standard deviations can be computed using G01ATF.

G07CAF.4 Mark 25

# 10 Example

This example reads the two sample sizes and the sample means and standard deviations for two independent samples. The data is taken from page 116 of Snedecor and Cochran (1967) from a test to compare two methods of estimating the concentration of a chemical in a vat. A test of the equality of the means is carried out first assuming that the two population variances are equal and then making no assumption about the equality of the population variances.
