NAG Library Routine Document

S30JBF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

S30JBF computes the European option price together with its sensitivities (Greeks) using the Merton jump-diffusion model.

2 Specification

```
SUBROUTINE S30JBF (CALPUT, M, N, X, S, T, SIGMA, R, LAMBDA, JVOL, P, LDP, DELTA, GAMMA, VEGA, THETA, RHO, VANNA, CHARM, SPEED, COLOUR, ZOMMA, VOMMA, IFAIL)

INTEGER

M, N, LDP, IFAIL

REAL (KIND=nag_wp) X(M), S, T(N), SIGMA, R, LAMBDA, JVOL, P(LDP,N), DELTA(LDP,N), GAMMA(LDP,N), VEGA(LDP,N), THETA(LDP,N), RHO(LDP,N), VANNA(LDP,N), CHARM(LDP,N), SPEED(LDP,N), COLOUR(LDP,N), ZOMMA(LDP,N), VOMMA(LDP,N)

CHARACTER(1) CALPUT
```

3 Description

S30JBF uses Merton's jump-diffusion model (Merton (1976)) to compute the price of a European option, together with the Greeks or sensitivities, which are the partial derivatives of the option price with respect to certain of the other input parameters. Merton's model assumes that the asset price is described by a Brownian motion with drift, as in the Black–Scholes–Merton case, together with a compound Poisson process to model the jumps. The corresponding stochastic differential equation is,

$$\frac{dS}{S} = (\alpha - \lambda k)dt + \hat{\sigma}dW_t + dq_t.$$

Here α is the instantaneous expected return on the asset price, S; $\hat{\sigma}^2$ is the instantaneous variance of the return when the Poisson event does not occur; dW_t is a standard Brownian motion; q_t is the independent Poisson process and k = E[Y-1] where Y-1 is the random variable change in the stock price if the Poisson event occurs and E is the expectation operator over the random variable Y.

This leads to the following price for a European option (see Haug (2007))

$$P_{\mathrm{call}} = \sum_{i=0}^{\infty} \frac{e^{-\lambda T} (\lambda T)^{j}}{j!} C_{j} \Big(S, X, T, r, \sigma'_{j} \Big),$$

where T is the time to expiry; X is the strike price; r is the annual risk-free interest rate; $C_j(S,X,T,r,\sigma_j')$ is the Black-Scholes-Merton option pricing formula for a European call (see S30AAF).

$$\sigma'_{j} = \sqrt{z^{2} + \delta^{2}(\frac{j}{T})},$$

$$z^{2} = \sigma^{2} - \lambda \delta^{2},$$

$$\delta^{2} = \frac{\gamma \sigma^{2}}{\lambda},$$

where σ is the total volatility including jumps; λ is the expected number of jumps given as an average per year; γ is the proportion of the total volatility due to jumps.

The value of a put is obtained by substituting the Black-Scholes-Merton put price for $C_j(S, X, T, r, \sigma'_j)$.

The option price $P_{ij} = P(X = X_i, T = T_j)$ is computed for each strike price in a set X_i , i = 1, 2, ..., m, and for each expiry time in a set T_j , j = 1, 2, ..., n.

5 Parameters

1: CALPUT - CHARACTER(1)

Input

On entry: determines whether the option is a call or a put.

CALPUT = 'C'

A call; the holder has a right to buy.

CALPUT = 'P'

A put; the holder has a right to sell.

Constraint: CALPUT = 'C' or 'P'.

2: M – INTEGER

Input

On entry: the number of strike prices to be used.

Constraint: $M \ge 1$.

3: N - INTEGER

Input

On entry: the number of times to expiry to be used.

Constraint: $N \ge 1$.

4: $X(M) - REAL (KIND=nag_wp) array$

Input

On entry: X(i) must contain X_i , the *i*th strike price, for i = 1, 2, ..., M.

Constraint: $X(i) \ge z$ and $X(i) \le 1/z$, where z = X02AMF(), the safe range parameter, for i = 1, 2, ..., M.

5: S - REAL (KIND=nag_wp)

Input

On entry: S, the price of the underlying asset.

Constraint: $S \ge z$ and $S \le 1.0/z$, where z = X02AMF(), the safe range parameter.

6: $T(N) - REAL (KIND=nag_wp) array$

Input

On entry: T(i) must contain T_i , the *i*th time, in years, to expiry, for i = 1, 2, ..., N.

Constraint: $T(i) \ge z$, where z = X02AMF(), the safe range parameter, for i = 1, 2, ..., N.

7: SIGMA – REAL (KIND=nag wp)

Input

On entry: σ , the annual total volatility, including jumps.

Constraint: SIGMA > 0.0.

S30JBF.2 Mark 25

8: R - REAL (KIND=nag wp)

Input

On entry: r, the annual risk-free interest rate, continuously compounded. Note that a rate of 5% should be entered as 0.05.

Constraint: $R \ge 0.0$.

9: LAMBDA – REAL (KIND=nag wp)

Input

On entry: λ , the number of expected jumps per year.

Constraint: LAMBDA > 0.0.

10: JVOL - REAL (KIND=nag wp)

Input

On entry: the proportion of the total volatility associated with jumps.

Constraint: $0.0 \le \text{JVOL} < 1.0$.

11: P(LDP, N) - REAL (KIND=nag wp) array

Output

On exit: P(i,j) contains P_{ij} , the option price evaluated for the strike price X_i at expiry T_j for i = 1, 2, ..., M and j = 1, 2, ..., N.

12: LDP – INTEGER

Input

On entry: the first dimension of the arrays P, DELTA, GAMMA, VEGA, THETA, RHO, VANNA, CHARM, SPEED, COLOUR, ZOMMA and VOMMA as declared in the (sub)program from which S30JBF is called.

Constraint: LDP \geq M.

13: DELTA(LDP, N) - REAL (KIND=nag_wp) array

Output

On exit: the leading M × N part of the array DELTA contains the sensitivity, $\frac{\partial P}{\partial S}$, of the option price to change in the price of the underlying asset.

14: $GAMMA(LDP, N) - REAL (KIND=nag_wp) array$

Output

On exit: the leading M × N part of the array GAMMA contains the sensitivity, $\frac{\partial^2 P}{\partial S^2}$, of DELTA to change in the price of the underlying asset.

15: VEGA(LDP, N) - REAL (KIND=nag wp) array

Output

On exit: VEGA(i,j), contains the first-order Greek measuring the sensitivity of the option price P_{ij} to change in the volatility of the underlying asset, i.e., $\frac{\partial P_{ij}}{\partial \sigma}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

16: THETA(LDP, N) - REAL (KIND=nag wp) array

Output

On exit: THETA(i,j), contains the first-order Greek measuring the sensitivity of the option price P_{ij} to change in time, i.e., $-\frac{\partial P_{ij}}{\partial T}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$, where b=r-q.

17: RHO(LDP, N) – REAL (KIND=nag wp) array

Output

On exit: RHO(i,j), contains the first-order Greek measuring the sensitivity of the option price P_{ij} to change in the annual risk-free interest rate, i.e., $-\frac{\partial P_{ij}}{\partial r}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

18: VANNA(LDP, N) – REAL (KIND=nag wp) array

Output

On exit: VANNA(i, j), contains the second-order Greek measuring the sensitivity of the first-order Greek Δ_{ij} to change in the volatility of the asset price, i.e., $-\frac{\partial \Delta_{ij}}{\partial T} = -\frac{\partial^2 P_{ij}}{\partial S \partial \sigma}$, for $i = 1, 2, \dots, M$ and $j = 1, 2, \dots, N$.

19: CHARM(LDP, N) - REAL (KIND=nag wp) array

Output

On exit: CHARM(i,j), contains the second-order Greek measuring the sensitivity of the first-order Greek Δ_{ij} to change in the time, i.e., $-\frac{\partial \Delta_{ij}}{\partial T} = -\frac{\partial^2 P_{ij}}{\partial S \partial T}$, for i = 1, 2, ..., M and j = 1, 2, ..., N.

20: SPEED(LDP, N) - REAL (KIND=nag wp) array

Outpu.

On exit: SPEED(i,j), contains the third-order Greek measuring the sensitivity of the second-order Greek Γ_{ij} to change in the price of the underlying asset, i.e., $-\frac{\partial \Gamma_{ij}}{\partial S} = -\frac{\partial^3 P_{ij}}{\partial S^3}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

21: COLOUR(LDP, N) - REAL (KIND=nag wp) array

Output

On exit: COLOUR(i,j), contains the third-order Greek measuring the sensitivity of the second-order Greek Γ_{ij} to change in the time, i.e., $-\frac{\partial \Gamma_{ij}}{\partial T} = -\frac{\partial^3 P_{ij}}{\partial S \partial T}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

22: ZOMMA(LDP, N) – REAL (KIND=nag_wp) array

Output

On exit: ZOMMA(i,j), contains the third-order Greek measuring the sensitivity of the second-order Greek Γ_{ij} to change in the volatility of the underlying asset, i.e., $-\frac{\partial \Gamma_{ij}}{\partial \sigma} = -\frac{\partial^3 P_{ij}}{\partial S^2 \partial \sigma}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

23: VOMMA(LDP, N) – REAL (KIND=nag wp) array

Output

On exit: VOMMA(i,j), contains the second-order Greek measuring the sensitivity of the first-order Greek Δ_{ij} to change in the volatility of the underlying asset, i.e., $-\frac{\partial \Delta_{ij}}{\partial \sigma} = -\frac{\partial^2 P_{ij}}{\partial \sigma^2}$, for $i=1,2,\ldots,M$ and $j=1,2,\ldots,N$.

24: IFAIL – INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. If you are unfamiliar with this parameter you should refer to Section 3.3 in the Essential Introduction for details.

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, if you are not familiar with this parameter, the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

On exit: IFAIL = 0 unless the routine detects an error or a warning has been flagged (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, CALPUT = $\langle value \rangle$ was an illegal value.

IFAIL = 2

On entry, $M = \langle value \rangle$. Constraint: $M \ge 1$.

IFAIL = 3

On entry, $N = \langle value \rangle$. Constraint: N > 1.

S30JBF.4 Mark 25

```
IFAIL = 4
        On entry, X(\langle value \rangle) = \langle value \rangle.
        Constraint: X(i) \ge \langle value \rangle and X(i) \le \langle value \rangle.
IFAIL = 5
        On entry, S = \langle value \rangle.
        Constraint: S \ge \langle value \rangle and S \le \langle value \rangle.
IFAIL = 6
        On entry, T(\langle value \rangle) = \langle value \rangle.
        Constraint: T(i) \ge \langle value \rangle.
IFAIL = 7
        On entry, SIGMA = \langle value \rangle.
        Constraint: SIGMA > 0.0.
IFAIL = 8
        On entry, R = \langle value \rangle.
        Constraint: R > 0.0.
IFAIL = 9
        On entry, LAMBDA = \langle value \rangle.
        Constraint: LAMBDA > 0.0.
IFAIL = 10
        On entry, JVOL = \langle value \rangle.
        Constraint: JVOL \geq 0.0 and JVOL < 1.0.
IFAIL = 12
        On entry, LDP = \langle value \rangle and M = \langle value \rangle.
        Constraint: LDP \geq M.
IFAIL = -99
        An unexpected error has been triggered by this routine. Please contact NAG.
        See Section 3.8 in the Essential Introduction for further information.
IFAIL = -399
        Your licence key may have expired or may not have been installed correctly.
```

IFAIL = -999

Dynamic memory allocation failed.

See Section 3.6 in the Essential Introduction for further information.

See Section 3.7 in the Essential Introduction for further information.

7 Accuracy

The accuracy of the output is dependent on the accuracy of the cumulative Normal distribution function, Φ , occurring in C_j . This is evaluated using a rational Chebyshev expansion, chosen so that the maximum relative error in the expansion is of the order of the *machine precision* (see S15ABF and S15ADF). An accuracy close to *machine precision* can generally be expected.

8 Parallelism and Performance

S30JBF is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example computes the price of two European calls with jumps. The time to expiry is 6 months, the stock price is 100 and strike prices are 80 and 90 respectively. The number of jumps per year is 5 and the percentage of the total volatility due to jumps is 25%. The risk-free interest rate is 8% per year while the total volatility is 25% per year.
