F08FGF (DORMTR)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08FGF (DORMTR) multiplies an arbitrary real matrix C by the real orthogonal matrix Q which was determined by F08FEF (DSYTRD) when reducing a real symmetric matrix to tridiagonal form.

2 Specification

```
SUBROUTINE F08FGF (SIDE, UPLO, TRANS, M, N, A, LDA, TAU, C, LDC, WORK, &
                  LWORK, INFO)
INTEGER          M, N, LDA, LDC, LWORK, INFO
REAL (KIND=nag_wp) A(LDA,*), TAU(*), C(LDC,*), WORK(max(1,LWORK))
CHARACTER(1)    SIDE, UPLO, TRANS
```

The routine may be called by its LAPACK name *dormtr*.

3 Description

F08FGF (DORMTR) is intended to be used after a call to F08FEF (DSYTRD), which reduces a real symmetric matrix A to symmetric tridiagonal form T by an orthogonal similarity transformation: $A = QTQ^T$. F08FEF (DSYTRD) represents the orthogonal matrix Q as a product of elementary reflectors.

This routine may be used to form one of the matrix products

$$QC, Q^T C, CQ \text{ or } CQ^T,$$

overwriting the result on C (which may be any real rectangular matrix).

A common application of this routine is to transform a matrix Z of eigenvectors of T to the matrix QZ of eigenvectors of A .

5 Arguments

1: SIDE – CHARACTER(1) *Input*

On entry: indicates how Q or Q^T is to be applied to C .

SIDE = 'L'

Q or Q^T is applied to C from the left.

SIDE = 'R'

Q or Q^T is applied to C from the right.

Constraint: SIDE = 'L' or 'R'.

- 2: UPLO – CHARACTER(1) *Input*
On entry: this **must** be the same argument UPLO as supplied to F08FEF (DSYTRD).
Constraint: UPLO = 'U' or 'L'.
- 3: TRANS – CHARACTER(1) *Input*
On entry: indicates whether Q or Q^T is to be applied to C .
 TRANS = 'N'
 Q is applied to C .
 TRANS = 'T'
 Q^T is applied to C .
Constraint: TRANS = 'N' or 'T'.
- 4: M – INTEGER *Input*
On entry: m , the number of rows of the matrix C ; m is also the order of Q if SIDE = 'L'.
Constraint: $M \geq 0$.
- 5: N – INTEGER *Input*
On entry: n , the number of columns of the matrix C ; n is also the order of Q if SIDE = 'R'.
Constraint: $N \geq 0$.
- 6: A(LDA,*) – REAL (KIND=nag_wp) array *Input*
Note: the second dimension of the array A must be at least $\max(1, M)$ if SIDE = 'L' and at least $\max(1, N)$ if SIDE = 'R'.
On entry: details of the vectors which define the elementary reflectors, as returned by F08FEF (DSYTRD).
- 7: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08FGF (DORMTR) is called.
Constraints:
 if SIDE = 'L', $LDA \geq \max(1, M)$;
 if SIDE = 'R', $LDA \geq \max(1, N)$.
- 8: TAU(*) – REAL (KIND=nag_wp) array *Input*
Note: the dimension of the array TAU must be at least $\max(1, M - 1)$ if SIDE = 'L' and at least $\max(1, N - 1)$ if SIDE = 'R'.
On entry: further details of the elementary reflectors, as returned by F08FEF (DSYTRD).
- 9: C(LDC,*) – REAL (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array C must be at least $\max(1, N)$.
On entry: the m by n matrix C .
On exit: C is overwritten by QC or $Q^T C$ or CQ or CQ^T as specified by SIDE and TRANS.
- 10: LDC – INTEGER *Input*
On entry: the first dimension of the array C as declared in the (sub)program from which F08FGF (DORMTR) is called.
Constraint: $LDC \geq \max(1, M)$.

- 11: WORK(max(1,LWORK)) – REAL (KIND=nag_wp) array Workspace
On exit: if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimal performance.
- 12: LWORK – INTEGER Input
On entry: the dimension of the array WORK as declared in the (sub)program from which F08FGF (DORMTR) is called.
 If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.
Suggested value: for optimal performance, LWORK $\geq N \times nb$ if SIDE = 'L' and at least $M \times nb$ if SIDE = 'R', where *nb* is the optimal **block size**.
Constraints:
 if SIDE = 'L', LWORK $\geq \max(1, N)$ or LWORK = -1;
 if SIDE = 'R', LWORK $\geq \max(1, M)$ or LWORK = -1.
- 13: INFO – INTEGER Output
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

INFO < 0

If INFO = -*i*, argument *i* had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed result differs from the exact result by a matrix *E* such that

$$\|E\|_2 = O(\epsilon)\|C\|_2,$$

where ϵ is the *machine precision*.

8 Parallelism and Performance

F08FGF (DORMTR) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08FGF (DORMTR) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $2m^2n$ if SIDE = 'L' and $2mn^2$ if SIDE = 'R'.

The complex analogue of this routine is F08FUF (ZUNMTR).

10 Example

This example computes the two smallest eigenvalues, and the associated eigenvectors, of the matrix A , where

$$A = \begin{pmatrix} 2.07 & 3.87 & 4.20 & -1.15 \\ 3.87 & -0.21 & 1.87 & 0.63 \\ 4.20 & 1.87 & 1.15 & 2.06 \\ -1.15 & 0.63 & 2.06 & -1.81 \end{pmatrix}.$$

Here A is symmetric and must first be reduced to tridiagonal form T by F08FEF (DSYTRD). The program then calls F08JJF (DSTEBZ) to compute the requested eigenvalues and F08JKF (DSTEIN) to compute the associated eigenvectors of T . Finally F08FGF (DORMTR) is called to transform the eigenvectors to those of A .
