

NAG Library Routine Document

F08VNF (ZGGSVD)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F08VNF (ZGGSVD) computes the generalized singular value decomposition (GSVD) of an m by n complex matrix A and a p by n complex matrix B . F08VNF (ZGGSVD) is marked as *deprecated* by LAPACK; the replacement routine is F08VQF (ZGGSVD3) which makes better use of level 3 BLAS.

2 Specification

```

SUBROUTINE F08VNF (JOBU, JOBV, JOBQ, M, N, P, K, L, A, LDA, B, LDB,      &
                  ALPHA, BETA, U, LDU, V, LDV, Q, LDQ, WORK, RWORK,    &
                  IWORK, INFO)
INTEGER                M, N, P, K, L, LDA, LDB, LDU, LDV, LDQ, IWORK(N), &
                      INFO
REAL (KIND=nag_wp)    ALPHA(N), BETA(N), RWORK(2*N)
COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), U(LDU,*), V(LDV,*),      &
                      Q(LDQ,*), WORK(max(3*N,M,P)+N)
CHARACTER(1)          JOBU, JOBV, JOBQ

```

The routine may be called by its LAPACK name ***zggsvd***.

3 Description

The generalized singular value decomposition is given by

$$U^H A Q = D_1 \begin{pmatrix} 0 & R \end{pmatrix}, \quad V^H B Q = D_2 \begin{pmatrix} 0 & R \end{pmatrix},$$

where U , V and Q are unitary matrices. Let $(k+l)$ be the effective numerical rank of the matrix $\begin{pmatrix} A \\ B \end{pmatrix}$, then R is a $(k+l)$ by $(k+l)$ nonsingular upper triangular matrix, D_1 and D_2 are m by $(k+l)$ and p by $(k+l)$ ‘diagonal’ matrices structured as follows:

if $m - k - l \geq 0$,

$$D_1 = \begin{matrix} & & k & l \\ & & \begin{pmatrix} I & 0 \\ 0 & C \end{pmatrix} \\ m - k - l & & \begin{pmatrix} 0 & 0 \end{pmatrix} \end{matrix}$$

$$D_2 = \begin{matrix} & & k & l \\ & & \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \\ p - l & & \begin{pmatrix} 0 & 0 \end{pmatrix} \end{matrix}$$

$$\begin{pmatrix} 0 & R \end{pmatrix} = \begin{matrix} & & n - k - l & k & l \\ k & & \begin{pmatrix} 0 & R_{11} & R_{12} \\ 0 & 0 & R_{22} \end{pmatrix} \\ l & & \begin{pmatrix} 0 & 0 & 0 & R_{22} \end{pmatrix} \end{matrix}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_{k+l}),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_{k+l}),$$

and

$$C^2 + S^2 = I.$$

R is stored as a submatrix of A with elements R_{ij} stored as $A_{i,n-k-l+j}$ on exit.

If $m - k - l < 0$,

$$D_1 = \begin{matrix} & k & m-k & k+l-m \\ & \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix} \end{matrix}$$

$$D_2 = \begin{matrix} & k & m-k & k+l-m \\ m-k & \begin{pmatrix} 0 & S & 0 \\ 0 & 0 & I \\ p-l & 0 & 0 \end{pmatrix} \\ k+l-m & & & \end{matrix}$$

$$(0 \ R) = \begin{matrix} & n-k-l & k & m-k & k+l-m \\ k & \begin{pmatrix} 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix} \\ m-k & & & & \\ k+l-m & & & & \end{matrix}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_m),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_m),$$

and

$$C^2 + S^2 = I.$$

$\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$ is stored as a submatrix of A with R_{ij} stored as $A_{i,n-k-l+j}$, and R_{33} is stored as a submatrix of B with $(R_{33})_{ij}$ stored as $B_{m-k+i,n+m-k-l+j}$.

The routine computes C , S , R and, optionally, the unitary transformation matrices U , V and Q .

In particular, if B is an n by n nonsingular matrix, then the GSVD of A and B implicitly gives the SVD of $A \times B^{-1}$:

$$AB^{-1} = U(D_1 D_2^{-1})V^H.$$

If $\begin{pmatrix} A \\ B \end{pmatrix}$ has orthonormal columns, then the GSVD of A and B is also equal to the CS decomposition of A and B . Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$$A^H A x = \lambda B^H B x.$$

In some literature, the GSVD of A and B is presented in the form

$$U^H A X = (0 \ D_1), \quad V^H B X = (0 \ D_2),$$

where U and V are orthogonal and X is nonsingular, and D_1 and D_2 are 'diagonal'. The former GSVD form can be converted to the latter form by taking the nonsingular matrix X as

$$X = Q \begin{pmatrix} I & 0 \\ 0 & R^{-1} \end{pmatrix}.$$

5 Arguments

- 1: JOBU – CHARACTER(1) *Input*
On entry: if JOBU = 'U', the unitary matrix U is computed.
 If JOBU = 'N', U is not computed.
Constraint: JOBU = 'U' or 'N'.
- 2: JOBV – CHARACTER(1) *Input*
On entry: if JOBV = 'V', the unitary matrix V is computed.
 If JOBV = 'N', V is not computed.
Constraint: JOBV = 'V' or 'N'.
- 3: JOBQ – CHARACTER(1) *Input*
On entry: if JOBQ = 'Q', the unitary matrix Q is computed.
 If JOBQ = 'N', Q is not computed.
Constraint: JOBQ = 'Q' or 'N'.
- 4: M – INTEGER *Input*
On entry: m , the number of rows of the matrix A .
Constraint: $M \geq 0$.
- 5: N – INTEGER *Input*
On entry: n , the number of columns of the matrices A and B .
Constraint: $N \geq 0$.
- 6: P – INTEGER *Input*
On entry: p , the number of rows of the matrix B .
Constraint: $P \geq 0$.
- 7: K – INTEGER *Output*
 8: L – INTEGER *Output*
On exit: K and L specify the dimension of the subblocks k and l as described in Section 3;
 $(k + l)$ is the effective numerical rank of $\begin{pmatrix} A \\ B \end{pmatrix}$.
- 9: A(LDA,*) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array A must be at least $\max(1, N)$.
On entry: the m by n matrix A .
On exit: contains the triangular matrix R , or part of R . See Section 3 for details.

- 10: LDA – INTEGER *Input*
On entry: the first dimension of the array A as declared in the (sub)program from which F08VNF (ZGGSVD) is called.
Constraint: $LDA \geq \max(1, M)$.
- 11: B(LDB, *) – COMPLEX (KIND=nag_wp) array *Input/Output*
Note: the second dimension of the array B must be at least $\max(1, N)$.
On entry: the p by n matrix B .
On exit: contains the triangular matrix R if $m - k - l < 0$. See Section 3 for details.
- 12: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F08VNF (ZGGSVD) is called.
Constraint: $LDB \geq \max(1, P)$.
- 13: ALPHA(N) – REAL (KIND=nag_wp) array *Output*
On exit: see the description of BETA.
- 14: BETA(N) – REAL (KIND=nag_wp) array *Output*
On exit: ALPHA and BETA contain the generalized singular value pairs of A and B , α_i and β_i ;
 $ALPHA(1 : K) = 1$,
 $BETA(1 : K) = 0$,
and if $m - k - l \geq 0$,
 $ALPHA(K + 1 : K + L) = C$,
 $BETA(K + 1 : K + L) = S$,
or if $m - k - l < 0$,
 $ALPHA(K + 1 : M) = C$,
 $ALPHA(M + 1 : K + L) = 0$,
 $BETA(K + 1 : M) = S$,
 $BETA(M + 1 : K + L) = 1$, and
 $ALPHA(K + L + 1 : N) = 0$,
 $BETA(K + L + 1 : N) = 0$.
The notation $ALPHA(K : N)$ above refers to consecutive elements $ALPHA(i)$, for $i = K, \dots, N$.
- 15: U(LDU, *) – COMPLEX (KIND=nag_wp) array *Output*
Note: the second dimension of the array U must be at least $\max(1, M)$ if $JOB_U = 'U'$, and at least 1 otherwise.
On exit: if $JOB_U = 'U'$, U contains the m by m unitary matrix U .
If $JOB_U = 'N'$, U is not referenced.
- 16: LDU – INTEGER *Input*
On entry: the first dimension of the array U as declared in the (sub)program from which F08VNF (ZGGSVD) is called.

Constraints:

if $\text{JOBV} = 'U'$, $\text{LDU} \geq \max(1, M)$;
 otherwise $\text{LDU} \geq 1$.

17: $V(\text{LDV}, *)$ – COMPLEX (KIND=nag_wp) array *Output*

Note: the second dimension of the array V must be at least $\max(1, P)$ if $\text{JOBV} = 'V'$, and at least 1 otherwise.

On exit: if $\text{JOBV} = 'V'$, V contains the p by p unitary matrix V .

If $\text{JOBV} = 'N'$, V is not referenced.

18: LDV – INTEGER *Input*

On entry: the first dimension of the array V as declared in the (sub)program from which F08VNF (ZGGSVD) is called.

Constraints:

if $\text{JOBV} = 'V'$, $\text{LDV} \geq \max(1, P)$;
 otherwise $\text{LDV} \geq 1$.

19: $Q(\text{LDQ}, *)$ – COMPLEX (KIND=nag_wp) array *Output*

Note: the second dimension of the array Q must be at least $\max(1, N)$ if $\text{JOBQ} = 'Q'$, and at least 1 otherwise.

On exit: if $\text{JOBQ} = 'Q'$, Q contains the n by n unitary matrix Q .

If $\text{JOBQ} = 'N'$, Q is not referenced.

20: LDQ – INTEGER *Input*

On entry: the first dimension of the array Q as declared in the (sub)program from which F08VNF (ZGGSVD) is called.

Constraints:

if $\text{JOBQ} = 'Q'$, $\text{LDQ} \geq \max(1, N)$;
 otherwise $\text{LDQ} \geq 1$.

21: $\text{WORK}(\max(3 \times N, M, P) + N)$ – COMPLEX (KIND=nag_wp) array *Workspace*

22: $\text{RWORK}(2 \times N)$ – REAL (KIND=nag_wp) array *Workspace*

23: $\text{IWORK}(N)$ – INTEGER array *Output*

On exit: stores the sorting information. More precisely, the following loop will sort ALPHA

```

for I=K+1, min(M, K+L)
  swap ALPHA(I) and ALPHA(IWORK(I))
endfor

```

such that $\text{ALPHA}(1) \geq \text{ALPHA}(2) \geq \dots \geq \text{ALPHA}(N)$.

24: INFO – INTEGER *Output*

On exit: $\text{INFO} = 0$ unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

$\text{INFO} < 0$

If $\text{INFO} = -i$, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1

If INFO = 1, the Jacobi-type procedure failed to converge.

7 Accuracy

The computed generalized singular value decomposition is nearly the exact generalized singular value decomposition for nearby matrices $(A + E)$ and $(B + F)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2 \text{ and } \|F\|_2 = O(\epsilon)\|B\|_2,$$

and ϵ is the *machine precision*. See Section 4.12 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

F08VNF (ZGGSVD) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The diagonal elements of the matrix R are real.

The real analogue of this routine is F08VAF (DGGSD).

10 Example

This example finds the generalized singular value decomposition

$$A = U\Sigma_1(0 \ R)Q^H, \quad B = V\Sigma_2(0 \ R)Q^H,$$

where

$$A = \begin{pmatrix} 0.96 - 0.81i & -0.03 + 0.96i & -0.91 + 2.06i & -0.05 + 0.41i \\ -0.98 + 1.98i & -1.20 + 0.19i & -0.66 + 0.42i & -0.81 + 0.56i \\ 0.62 - 0.46i & 1.01 + 0.02i & 0.63 - 0.17i & -1.11 + 0.60i \\ 0.37 + 0.38i & 0.19 - 0.54i & -0.98 - 0.36i & 0.22 - 0.20i \\ 0.83 + 0.51i & 0.20 + 0.01i & -0.17 - 0.46i & 1.47 + 1.59i \\ 1.08 - 0.28i & 0.20 - 0.12i & -0.07 + 1.23i & 0.26 + 0.26i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \end{pmatrix},$$

together with estimates for the condition number of R and the error bound for the computed generalized singular values.

The example program assumes that $m \geq n$, and would need slight modification if this is not the case.
