

NAG Library Routine Document

F06WCF (DSFRK)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F06WCF (DSFRK) performs one of the symmetric rank- k update operations

$$C \leftarrow \alpha AA^T + \beta C \quad \text{or} \quad C \leftarrow \alpha A^T A + \beta C,$$

where A is a real matrix, C is an n by n real symmetric matrix stored in Rectangular Full Packed (RFP) format, and α and β are real scalars.

2 Specification

```
SUBROUTINE F06WCF (TRANSR, UPLO, TRANS, N, K, ALPHA, A, LDA, BETA, CR)
INTEGER N, K, LDA
REAL (KIND=nag_wp) ALPHA, A(LDA,*), BETA, CR(N*(N+1)/2)
CHARACTER(1) TRANSR, UPLO, TRANS
```

The routine may be called by its LAPACK name *dsfrk*.

3 Description

F06WCF (DSFRK) performs one of the symmetric rank- k update operations

$$C \leftarrow \alpha AA^T + \beta C \quad \text{or} \quad C \leftarrow \alpha A^T A + \beta C,$$

where A is a real matrix, C is an n by n real symmetric matrix stored in Rectangular Full Packed (RFP) format, and α and β are real scalars. The RFP storage format is described in Section 3.3.3 in the F07 Chapter Introduction.

If $n = 0$ or if $\beta = 1.0$ and either $k = 0$ or $\alpha = 0.0$ then F06WCF (DSFRK) returns immediately. If $\beta=0.0$ and either $k=0$ or $\alpha = 0.0$ then C is set to the zero matrix.

4 References

5 Arguments

1: TRANSR – CHARACTER(1)	<i>Input</i>
-----------------------------	--------------

On entry: specifies whether the RFP representation of C is normal or transposed.

TRANSR = 'N'

The matrix C is stored in normal RFP format.

TRANSR = 'T'

The matrix C is stored in transposed RFP format.

Constraint: TRANSR = 'N' or 'T'.

2: UPLO – CHARACTER(1) *Input*

On entry: specifies whether the upper or lower triangular part of C is stored in RFP format.

UPLO = 'U'

The upper triangular part of C is stored in RFP format.

UPLO = 'L'

The lower triangular part of C is stored in RFP format.

Constraint: UPLO = 'U' or 'L'.

3: TRANS – CHARACTER(1) *Input*

On entry: specifies the operation to be performed.

TRANS = 'N'

$C \leftarrow \alpha A A^T + \beta C.$

TRANS = 'T'

$C \leftarrow \alpha A^T A + \beta C.$

Constraint: TRANS = 'N' or 'T'.

4: N – INTEGER *Input*

On entry: n , the order of the matrix C .

Constraint: $N \geq 0$.

5: K – INTEGER *Input*

On entry: k , the number of columns of A if TRANS = 'N', or the number of rows of A if TRANS = 'T'.

Constraint: $K \geq 0$.

6: ALPHA – REAL (KIND=nag_wp) *Input*

On entry: the scalar α .

7: A(LDA,*) – REAL (KIND=nag_wp) array *Input*

Note: the second dimension of the array A must be at least max(1,K) if TRANS = 'N' and at least max(1,N) if TRANS = 'T'.

On entry: the matrix A ; A is n by k if TRANS = 'N', or k by n if TRANS = 'T'. If ALPHA = 0.0, A is not referenced.

8: LDA – INTEGER *Input*

On entry: the first dimension of the array A as declared in the (sub)program from which F06WCF (DSFRK) is called.

Constraints:

if TRANS = 'N', $LDA \geq \max(1, N)$;
if TRANS = 'T', $LDA \geq \max(1, K)$.

9: BETA – REAL (KIND=nag_wp) *Input*

On entry: the scalar β .

10: CR(N × (N + 1)/2) – REAL (KIND=nag_wp) array *Input/Output*

On entry: the upper or lower triangular part (as specified by UPLO) of the n by n symmetric matrix C , stored in RFP format (as specified by TRANSR). The storage format is described in detail in Section 3.3.3 in the F07 Chapter Introduction.

On exit: the updated matrix C , that is its upper or lower triangular part stored in RFP format.

6 Error Indicators and Warnings

None.

7 Accuracy

Not applicable.

8 Parallelism and Performance

F06WCF (DSFRK) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example reads in the lower triangular part of a symmetric matrix C which it converts to RFP format. It also reads in α , β and a 6 by 4 matrix A and then performs the symmetric rank-4 update $C \leftarrow \alpha A A^T + \beta C$.
