# NAG Library Routine Document F08WNF (ZGGEV)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

## 1 Purpose

F08WNF (ZGGEV) computes for a pair of n by n complex nonsymmetric matrices (A,B) the generalized eigenvalues and, optionally, the left and/or right generalized eigenvectors using the QZ algorithm. F08WNF (ZGGEV) is marked as *deprecated* by LAPACK; the replacement routine is F08WQF (ZGGEV3) which makes better use of level 3 BLAS.

## 2 Specification

```
SUBROUTINE FO8WNF (JOBVL, JOBVR, N, A, LDA, B, LDB, ALPHA, BETA, VL, LDVL, VR, LDVR, WORK, LWORK, RWORK, INFO)

INTEGER

N, LDA, LDB, LDVL, LDVR, LWORK, INFO

REAL (KIND=nag_wp)

RWORK(max(1,8*N))

COMPLEX (KIND=nag_wp)

A(LDA,*), B(LDB,*), ALPHA(N), BETA(N), VL(LDVL,*), VR(LDVR,*), WORK(max(1,LWORK))

CHARACTER(1)

JOBVL, JOBVR
```

The routine may be called by its LAPACK name zggev.

## 3 Description

A generalized eigenvalue for a pair of matrices (A,B) is a scalar  $\lambda$  or a ratio  $\alpha/\beta=\lambda$ , such that  $A-\lambda B$  is singular. It is usually represented as the pair  $(\alpha,\beta)$ , as there is a reasonable interpretation for  $\beta=0$ , and even for both being zero.

The right generalized eigenvector  $v_j$  corresponding to the generalized eigenvalue  $\lambda_j$  of (A, B) satisfies

$$Av_j = \lambda_j Bv_j.$$

The left generalized eigenvector  $u_j$  corresponding to the generalized eigenvalue  $\lambda_j$  of (A, B) satisfies

$$u_j^{\mathrm{H}} A = \lambda_j u_j^{\mathrm{H}} B,$$

where  $u_j^{\mathrm{H}}$  is the conjugate-transpose of  $u_j$ .

All the eigenvalues and, if required, all the eigenvectors of the complex generalized eigenproblem  $Ax = \lambda Bx$ , where A and B are complex, square matrices, are determined using the QZ algorithm. The complex QZ algorithm consists of three stages:

- 1. A is reduced to upper Hessenberg form (with real, non-negative subdiagonal elements) and at the same time B is reduced to upper triangular form.
- 2. A is further reduced to triangular form while the triangular form of B is maintained and the diagonal elements of B are made real and non-negative. This is the generalized Schur form of the pair (A, B).

This routine does not actually produce the eigenvalues  $\lambda_j$ , but instead returns  $\alpha_j$  and  $\beta_j$  such that

$$\lambda_j = \alpha_j/\beta_j, \quad j = 1, 2, \dots, n.$$

The division by  $\beta_j$  becomes your responsibility, since  $\beta_j$  may be zero, indicating an infinite eigenvalue.

3. If the eigenvectors are required they are obtained from the triangular matrices and then transformed back into the original coordinate system.

# 5 Arguments

## 1: JOBVL – CHARACTER(1)

Input

On entry: if JOBVL = 'N', do not compute the left generalized eigenvectors.

If JOBVL = 'V', compute the left generalized eigenvectors.

Constraint: JOBVL = 'N' or 'V'.

# 2: JOBVR - CHARACTER(1)

Input

On entry: if JOBVR = 'N', do not compute the right generalized eigenvectors.

If JOBVR = 'V', compute the right generalized eigenvectors.

Constraint: JOBVR = 'N' or 'V'.

#### 3: N – INTEGER

Input

On entry: n, the order of the matrices A and B.

Constraint:  $N \ge 0$ .

## 4: A(LDA,\*) - COMPLEX (KIND=nag wp) array

Input/Output

**Note**: the second dimension of the array A must be at least max(1, N).

On entry: the matrix A in the pair (A, B).

On exit: A has been overwritten.

## 5: LDA – INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08WNF (ZGGEV) is called.

Constraint: LDA  $\geq \max(1, N)$ .

## 6: B(LDB, \*) - COMPLEX (KIND=nag wp) array

Input/Output

**Note**: the second dimension of the array B must be at least max(1, N).

On entry: the matrix B in the pair (A, B).

On exit: B has been overwritten.

#### 7: LDB – INTEGER

Input

On entry: the first dimension of the array B as declared in the (sub)program from which F08WNF (ZGGEV) is called.

*Constraint*: LDB  $\geq \max(1, N)$ .

F08WNF.2 Mark 26

8: ALPHA(N) – COMPLEX (KIND=nag wp) array

Output

On exit: see the description of BETA.

9: BETA(N) - COMPLEX (KIND=nag wp) array

Output

On exit: ALPHA(j)/BETA(j), for j = 1, 2, ..., N, will be the generalized eigenvalues.

**Note:** the quotients ALPHA(j)/BETA(j) may easily overflow or underflow, and BETA(j) may even be zero. Thus, you should avoid naively computing the ratio  $\alpha_j/\beta_j$ . However,  $\max |\alpha_j|$  will always be less than and usually comparable with  $||A||_2$  in magnitude, and  $\max |\beta_j|$  will always be less than and usually comparable with  $||B||_2$ .

10: VL(LDVL,\*) - COMPLEX (KIND=nag wp) array

Output

**Note**: the second dimension of the array VL must be at least max(1, N) if JOBVL = 'V', and at least 1 otherwise.

On exit: if JOBVL = 'V', the left generalized eigenvectors  $u_j$  are stored one after another in the columns of VL, in the same order as the corresponding eigenvalues. Each eigenvector will be scaled so the largest component will have |real part| + |imag. part| = 1.

If JOBVL = 'N', VL is not referenced.

11: LDVL – INTEGER

Input

On entry: the first dimension of the array VL as declared in the (sub)program from which F08WNF (ZGGEV) is called.

Constraints:

```
if JOBVL = 'V', LDVL \ge max(1, N); otherwise LDVL \ge 1.
```

12: VR(LDVR,\*) - COMPLEX (KIND=nag wp) array

Output

**Note**: the second dimension of the array VR must be at least max(1, N) if JOBVR = 'V', and at least 1 otherwise.

On exit: if JOBVR = 'V', the right generalized eigenvectors  $v_j$  are stored one after another in the columns of VR, in the same order as the corresponding eigenvalues. Each eigenvector will be scaled so the largest component will have |real part| + |imag. part| = 1.

If JOBVR = 'N', VR is not referenced.

13: LDVR - INTEGER

Input

On entry: the first dimension of the array VR as declared in the (sub)program from which F08WNF (ZGGEV) is called.

Constraints:

```
if JOBVR = 'V', LDVR \ge max(1, N); otherwise LDVR \ge 1.
```

14: WORK(max(1, LWORK)) – COMPLEX (KIND=nag wp) array

Workspace

On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimal performance.

15: LWORK – INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08WNF (ZGGEV) is called.

Mark 26 F08WNF.3

F08WNF NAG Library Manual

If LWORK = -1, a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.

Suggested value: for optimal performance, LWORK must generally be larger than the minimum; increase workspace by, say,  $nb \times N$ , where nb is the optimal **block size**.

*Constraint*: LWORK  $\geq \max(1, 2 \times N)$ .

16:  $RWORK(max(1, 8 \times N)) - REAL (KIND=nag_wp) array$ 

Workspace

17: INFO – INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

# 6 Error Indicators and Warnings

INFO < 0

If INFO = -i, argument i had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

The QZ iteration failed. No eigenvectors have been calculated, but ALPHA(j) and BETA(j) should be correct for j = INFO + 1, ..., N.

INFO = N + 1

Unexpected error returned from F08XSF (ZHGEQZ).

INFO = N + 2

Error returned from F08YXF (ZTGEVC).

## 7 Accuracy

The computed eigenvalues and eigenvectors are exact for nearby matrices (A + E) and (B + F), where

$$||(E, F)||_F = O(\epsilon)||(A, B)||_F,$$

and  $\epsilon$  is the *machine precision*. See Section 4.11 of Anderson *et al.* (1999) for further details.

**Note:** interpretation of results obtained with the QZ algorithm often requires a clear understanding of the effects of small changes in the original data. These effects are reviewed in Wilkinson (1979), in relation to the significance of small values of  $\alpha_j$  and  $\beta_j$ . It should be noted that if  $\alpha_j$  and  $\beta_j$  are **both** small for any j, it may be that no reliance can be placed on **any** of the computed eigenvalues  $\lambda_i = \alpha_i/\beta_i$ . You are recommended to study Wilkinson (1979) and, if in difficulty, to seek expert advice on determining the sensitivity of the eigenvalues to perturbations in the data.

## 8 Parallelism and Performance

F08WNF (ZGGEV) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08WNF (ZGGEV) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

F08WNF.4 Mark 26

#### 9 Further Comments

The total number of floating-point operations is proportional to  $n^3$ .

The real analogue of this routine is F08WAF (DGGEV).

## 10 Example

This example finds all the eigenvalues and right eigenvectors of the matrix pair (A, B), where

$$A = \begin{pmatrix} -21.10 - 22.50i & 53.50 - 50.50i & -34.50 + 127.50i & 7.50 + 0.50i \\ -0.46 - 7.78i & -3.50 - 37.50i & -15.50 + 58.50i & -10.50 - 1.50i \\ 4.30 - 5.50i & 39.70 - 17.10i & -68.50 + 12.50i & -7.50 - 3.50i \\ 5.50 + 4.40i & 14.40 + 43.30i & -32.50 - 46.00i & -19.00 - 32.50i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 1.00 - 5.00i & 1.60 + 1.20i & -3.00 + 0.00i & 0.00 - 1.00i \\ 0.80 - 0.60i & 3.00 - 5.00i & -4.00 + 3.00i & -2.40 - 3.20i \\ 1.00 + 0.00i & 2.40 + 1.80i & -4.00 - 5.00i & 0.00 - 3.00i \\ 0.00 + 1.00i & -1.80 + 2.40i & 0.00 - 4.00i & 4.00 - 5.00i \end{pmatrix}$$

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.
