

## NAG Library Routine Document

### F08XNF (ZGGES)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

#### 1 Purpose

F08XNF (ZGGES) computes the generalized eigenvalues, the generalized Schur form  $(S, T)$  and, optionally, the left and/or right generalized Schur vectors for a pair of  $n$  by  $n$  complex nonsymmetric matrices  $(A, B)$ . F08XNF (ZGGES) is marked as *deprecated* by LAPACK; the replacement routine is F08XQF (ZGGES3) which makes better use of level 3 BLAS.

#### 2 Specification

```

SUBROUTINE F08XNF (JOBVSL, JOBVSR, SORT, SELCTG, N, A, LDA, B, LDB,      &
                  SDIM, ALPHA, BETA, VSL, LDVSL, VSR, LDVSR, WORK,      &
                  LWORK, RWORK, BWORK, INFO)
INTEGER                N, LDA, LDB, SDIM, LDVSL, LDVSR, LWORK, INFO
REAL (KIND=nag_wp)    RWORK(max(1,8*N))
COMPLEX (KIND=nag_wp) A(LDA,*), B(LDB,*), ALPHA(N), BETA(N),          &
                    VSL(LDVSL,*), VSR(LDVSR,*), WORK(max(1,LWORK))
LOGICAL                SELCTG, BWORK(*)
CHARACTER(1)           JOBVSL, JOBVSR, SORT
EXTERNAL               SELCTG

```

The routine may be called by its LAPACK name *zgges*.

#### 3 Description

The generalized Schur factorization for a pair of complex matrices  $(A, B)$  is given by

$$A = QSZ^H, \quad B = QTZ^H,$$

where  $Q$  and  $Z$  are unitary,  $T$  and  $S$  are upper triangular. The generalized eigenvalues,  $\lambda$ , of  $(A, B)$  are computed from the diagonals of  $T$  and  $S$  and satisfy

$$Az = \lambda Bz,$$

where  $z$  is the corresponding generalized eigenvector.  $\lambda$  is actually returned as the pair  $(\alpha, \beta)$  such that

$$\lambda = \alpha/\beta$$

since  $\beta$ , or even both  $\alpha$  and  $\beta$  can be zero. The columns of  $Q$  and  $Z$  are the left and right generalized Schur vectors of  $(A, B)$ .

Optionally, F08XNF (ZGGES) can order the generalized eigenvalues on the diagonals of  $(S, T)$  so that selected eigenvalues are at the top left. The leading columns of  $Q$  and  $Z$  then form an orthonormal basis for the corresponding eigenspaces, the deflating subspaces.

F08XNF (ZGGES) computes  $T$  to have real non-negative diagonal entries. The generalized Schur factorization, before reordering, is computed by the  $QZ$  algorithm.

## 5 Arguments

- 1: JOBVSL – CHARACTER(1) *Input*  
*On entry:* if JOBVSL = 'N', do not compute the left Schur vectors.  
 If JOBVSL = 'V', compute the left Schur vectors.  
*Constraint:* JOBVSL = 'N' or 'V'.
- 2: JOBVSR – CHARACTER(1) *Input*  
*On entry:* if JOBVSR = 'N', do not compute the right Schur vectors.  
 If JOBVSR = 'V', compute the right Schur vectors.  
*Constraint:* JOBVSR = 'N' or 'V'.
- 3: SORT – CHARACTER(1) *Input*  
*On entry:* specifies whether or not to order the eigenvalues on the diagonal of the generalized Schur form.  
 SORT = 'N'  
 Eigenvalues are not ordered.  
 SORT = 'S'  
 Eigenvalues are ordered (see SELCTG).  
*Constraint:* SORT = 'N' or 'S'.
- 4: SELCTG – LOGICAL FUNCTION, supplied by the user. *External Procedure*  
 If SORT = 'S', SELCTG is used to select generalized eigenvalues to be moved to the top left of the generalized Schur form.  
 If SORT = 'N', SELCTG is not referenced by F08XNF (ZGGES), and may be called with the dummy function F08XNZ.

The specification of SELCTG is:

```
FUNCTION SELCTG (A, B)
  LOGICAL SELCTG
  COMPLEX (KIND=nag_wp) A, B
```

1: A – COMPLEX (KIND=nag\_wp) *Input*

2: B – COMPLEX (KIND=nag\_wp) *Input*

*On entry:* an eigenvalue  $A(j)/B(j)$  is selected if  $\text{SELCTG}(A(j), B(j))$  is .TRUE..

Note that in the ill-conditioned case, a selected generalized eigenvalue may no longer satisfy  $\text{SELCTG}(A(j), B(j)) = \text{.TRUE.}$  after ordering. INFO = N + 2 in this case.

SELCTG must either be a module subprogram USEd by, or declared as EXTERNAL in, the (sub) program from which F08XNF (ZGGES) is called. Arguments denoted as *Input* must **not** be changed by this procedure.

- 5: N – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrices  $A$  and  $B$ .  
*Constraint:*  $N \geq 0$ .
- 6: A(LDA,\*) – COMPLEX (KIND=nag\_wp) array *Input/Output*  
**Note:** the second dimension of the array  $A$  must be at least  $\max(1, N)$ .  
*On entry:* the first of the pair of matrices,  $A$ .

*On exit:* A has been overwritten by its generalized Schur form  $S$ .

- 7: LDA – INTEGER *Input*  
*On entry:* the first dimension of the array A as declared in the (sub)program from which F08XNF (ZGGES) is called.  
*Constraint:*  $LDA \geq \max(1, N)$ .
- 8: B(LDB, \*) – COMPLEX (KIND=nag\_wp) array *Input/Output*  
**Note:** the second dimension of the array B must be at least  $\max(1, N)$ .  
*On entry:* the second of the pair of matrices,  $B$ .  
*On exit:* B has been overwritten by its generalized Schur form  $T$ .
- 9: LDB – INTEGER *Input*  
*On entry:* the first dimension of the array B as declared in the (sub)program from which F08XNF (ZGGES) is called.  
*Constraint:*  $LDB \geq \max(1, N)$ .
- 10: SDIM – INTEGER *Output*  
*On exit:* if SORT = 'N', SDIM = 0.  
 If SORT = 'S', SDIM = number of eigenvalues (after sorting) for which SELCTG is .TRUE..
- 11: ALPHA(N) – COMPLEX (KIND=nag\_wp) array *Output*  
*On exit:* see the description of BETA.
- 12: BETA(N) – COMPLEX (KIND=nag\_wp) array *Output*  
*On exit:* ALPHA( $j$ )/BETA( $j$ ), for  $j = 1, 2, \dots, N$ , will be the generalized eigenvalues. ALPHA( $j$ ), for  $j = 1, 2, \dots, N$  and BETA( $j$ ), for  $j = 1, 2, \dots, N$ , are the diagonals of the complex Schur form ( $A, B$ ) output by F08XNF (ZGGES). The BETA( $j$ ) will be non-negative real.  
**Note:** the quotients ALPHA( $j$ )/BETA( $j$ ) may easily overflow or underflow, and BETA( $j$ ) may even be zero. Thus, you should avoid naively computing the ratio  $\alpha/\beta$ . However, ALPHA will always be less than and usually comparable with  $\|A\|_2$  in magnitude, and BETA will always be less than and usually comparable with  $\|B\|_2$ .
- 13: VSL(LDVSL, \*) – COMPLEX (KIND=nag\_wp) array *Output*  
**Note:** the second dimension of the array VSL must be at least  $\max(1, N)$  if JOBVSL = 'V', and at least 1 otherwise.  
*On exit:* if JOBVSL = 'V', VSL will contain the left Schur vectors,  $Q$ .  
 If JOBVSL = 'N', VSL is not referenced.
- 14: LDVSL – INTEGER *Input*  
*On entry:* the first dimension of the array VSL as declared in the (sub)program from which F08XNF (ZGGES) is called.  
*Constraints:*  
     if JOBVSL = 'V',  $LDVSL \geq \max(1, N)$ ;  
     otherwise  $LDVSL \geq 1$ .

- 15: VSR(LDVSR,\*) – COMPLEX (KIND=nag\_wp) array Output  
**Note:** the second dimension of the array VSR must be at least  $\max(1, N)$  if  $\text{JOBVSR} = 'V'$ , and at least 1 otherwise.  
*On exit:* if  $\text{JOBVSR} = 'V'$ , VSR will contain the right Schur vectors,  $Z$ .  
 If  $\text{JOBVSR} = 'N'$ , VSR is not referenced.
- 16: LDVSR – INTEGER Input  
*On entry:* the first dimension of the array VSR as declared in the (sub)program from which F08XNF (ZGGES) is called.  
*Constraints:*  
     if  $\text{JOBVSR} = 'V'$ ,  $\text{LDVSR} \geq \max(1, N)$ ;  
     otherwise  $\text{LDVSR} \geq 1$ .
- 17: WORK( $\max(1, \text{LWORK})$ ) – COMPLEX (KIND=nag\_wp) array Workspace  
*On exit:* if  $\text{INFO} = 0$ , the real part of  $\text{WORK}(1)$  contains the minimum value of LWORK required for optimal performance.
- 18: LWORK – INTEGER Input  
*On entry:* the dimension of the array WORK as declared in the (sub)program from which F08XNF (ZGGES) is called.  
 If  $\text{LWORK} = -1$ , a workspace query is assumed; the routine only calculates the optimal size of the WORK array, returns this value as the first entry of the WORK array, and no error message related to LWORK is issued.  
*Suggested value:* for optimal performance, LWORK must generally be larger than the minimum, say  $2 \times N + nb \times N$ , where  $nb$  is the optimal **block size** for F08NSF (ZGEHRD).  
*Constraint:*  $\text{LWORK} \geq \max(1, 2 \times N)$ .
- 19: RWORK( $\max(1, 8 \times N)$ ) – REAL (KIND=nag\_wp) array Workspace
- 20: BWORK(\*) – LOGICAL array Workspace  
**Note:** the dimension of the array BWORK must be at least 1 if  $\text{SORT} = 'N'$ , and at least  $\max(1, N)$  otherwise.  
 If  $\text{SORT} = 'N'$ , BWORK is not referenced.
- 21: INFO – INTEGER Output  
*On exit:*  $\text{INFO} = 0$  unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

INFO < 0

If  $\text{INFO} = -i$ , argument  $i$  had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO = 1 to N

The  $QZ$  iteration failed.  $(A, B)$  are not in Schur form, but  $\text{ALPHA}(j)$  and  $\text{BETA}(j)$  should be correct for  $j = \text{INFO} + 1, \dots, N$ .

INFO = N + 1

Unexpected error returned from F08XSF (ZHGEQZ).

INFO = N + 2

After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the generalized Schur form no longer satisfy SELCTG = .TRUE.. This could also be caused by underflow due to scaling.

INFO = N + 3

The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

## 7 Accuracy

The computed generalized Schur factorization satisfies

$$A + E = QSZ^H, \quad B + F = QTZ^H,$$

where

$$\|(E, F)\|_F = O(\epsilon)\|(A, B)\|_F$$

and  $\epsilon$  is the *machine precision*. See Section 4.11 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

F08XNF (ZGGES) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

F08XNF (ZGGES) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this routine. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of floating-point operations is proportional to  $n^3$ .

The real analogue of this routine is F08XAF (DGGES).

## 10 Example

This example finds the generalized Schur factorization of the matrix pair  $(A, B)$ , where

$$A = \begin{pmatrix} -21.10 - 22.50i & 53.50 - 50.50i & -34.50 + 127.50i & 7.50 + 0.50i \\ -0.46 - 7.78i & -3.50 - 37.50i & -15.50 + 58.50i & -10.50 - 1.50i \\ 4.30 - 5.50i & 39.70 - 17.10i & -68.50 + 12.50i & -7.50 - 3.50i \\ 5.50 + 4.40i & 14.40 + 43.30i & -32.50 - 46.00i & -19.00 - 32.50i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 1.00 - 5.00i & 1.60 + 1.20i & -3.00 + 0.00i & 0.00 - 1.00i \\ 0.80 - 0.60i & 3.00 - 5.00i & -4.00 + 3.00i & -2.40 - 3.20i \\ 1.00 + 0.00i & 2.40 + 1.80i & -4.00 - 5.00i & 0.00 - 3.00i \\ 0.00 + 1.00i & -1.80 + 2.40i & 0.00 - 4.00i & 4.00 - 5.00i \end{pmatrix}.$$

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.
