

NAG Toolbox

nag_linsys_real_symm_solve (f04bh)

1 Purpose

`nag_linsys_real_symm_solve` (f04bh) computes the solution to a real system of linear equations $AX = B$, where A is an n by n symmetric matrix and X and B are n by r matrices. An estimate of the condition number of A and an error bound for the computed solution are also returned.

2 Syntax

```
[a, ipiv, b, rcond, errbnd, ifail] = nag_linsys_real_symm_solve(uplo, a, b, 'n',
n, 'nrhs_p', nrhs_p)
[a, ipiv, b, rcond, errbnd, ifail] = f04bh(uplo, a, b, 'n', n, 'nrhs_p', nrhs_p)
```

3 Description

The diagonal pivoting method is used to factor A as $A = UDU^T$, if **uplo** = 'U', or $A = LDL^T$, if **uplo** = 'L', where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations $AX = B$.

5 Parameters

5.1 Compulsory Input Parameters

1: **uplo** – CHARACTER(1)

If **uplo** = 'U', the upper triangle of the matrix A is stored.

If **uplo** = 'L', the lower triangle of the matrix A is stored.

Constraint: **uplo** = 'U' or 'L'.

2: **a**(*lda*,:) – REAL (KIND=`nag_wp`) array

The first dimension of the array **a** must be at least $\max(1, \mathbf{n})$.

The second dimension of the array **a** must be at least $\max(1, \mathbf{n})$.

The n by n symmetric matrix A .

If **uplo** = 'U', the leading \mathbf{n} by \mathbf{n} upper triangular part of the array **a** contains the upper triangular part of the matrix A , and the strictly lower triangular part of **a** is not referenced.

If **uplo** = 'L', the leading \mathbf{n} by \mathbf{n} lower triangular part of the array **a** contains the lower triangular part of the matrix A , and the strictly upper triangular part of **a** is not referenced.

3: **b**(*ldb*,:) – REAL (KIND=`nag_wp`) array

The first dimension of the array **b** must be at least $\max(1, \mathbf{n})$.

The second dimension of the array **b** must be at least $\max(1, \mathbf{nrhs_p})$.

The n by r matrix of right-hand sides B .

5.2 Optional Input Parameters

1: **n** – INTEGER

Default: the first dimension of the arrays **a**, **b** and the second dimension of the array **a**.

The number of linear equations n , i.e., the order of the matrix A .

Constraint: $\mathbf{n} \geq 0$.

2: **nrhs_p** – INTEGER

Default: the second dimension of the array **b**.

The number of right-hand sides r , i.e., the number of columns of the matrix B .

Constraint: $\mathbf{nrhs_p} \geq 0$.

5.3 Output Parameters

1: **a(lda, :)** – REAL (KIND=nag_wp) array

The first dimension of the array **a** will be $\max(1, \mathbf{n})$.

The second dimension of the array **a** will be $\max(1, \mathbf{n})$.

If **ifail** ≥ 0 , the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization $A = UDU^T$ or $A = LDL^T$ as computed by nag_lapack_dsytrf (f07md).

2: **ipiv(n)** – INTEGER array

If **ifail** ≥ 0 , details of the interchanges and the block structure of D , as determined by nag_lapack_dsytrf (f07md).

ipiv(k) > 0

Rows and columns k and **ipiv(k)** were interchanged, and d_{kk} is a 1 by 1 diagonal block.

uplo = 'U' and **ipiv(k)** = **ipiv(k - 1)** < 0

Rows and columns $k - 1$ and $-\mathbf{ipiv}(k)$ were interchanged and $d_{k-1:k, k-1:k}$ is a 2 by 2 diagonal block.

uplo = 'L' and **ipiv(k)** = **ipiv(k + 1)** < 0

Rows and columns $k + 1$ and $-\mathbf{ipiv}(k)$ were interchanged and $d_{k:k+1, k:k+1}$ is a 2 by 2 diagonal block.

3: **b(ldb, :)** – REAL (KIND=nag_wp) array

The first dimension of the array **b** will be $\max(1, \mathbf{n})$.

The second dimension of the array **b** will be $\max(1, \mathbf{nrhs_p})$.

If **ifail** = 0 or $\mathbf{n} + 1$, the n by r solution matrix X .

4: **rcond** – REAL (KIND=nag_wp)

If no constraints are violated, an estimate of the reciprocal of the condition number of the matrix A , computed as $\mathbf{rcond} = 1 / (\|A\|_1 \|A^{-1}\|_1)$.

5: **errbnd** – REAL (KIND=nag_wp)

If **ifail** = 0 or $\mathbf{n} + 1$, an estimate of the forward error bound for a computed solution \hat{x} , such that $\|\hat{x} - x\|_1 / \|x\|_1 \leq \mathbf{errbnd}$, where \hat{x} is a column of the computed solution returned in the array **b**

and x is the corresponding column of the exact solution X . If **rcond** is less than *machine precision*, then **errbnd** is returned as unity.

6: **ifail** – INTEGER

ifail = 0 unless the function detects an error (see Section 5).

6 Error Indicators and Warnings

Errors or warnings detected by the function:

ifail > 0 and **ifail** ≤ **n**

Diagonal block $\langle value \rangle$ of the block diagonal matrix is zero. The factorization has been completed, but the solution could not be computed.

ifail = **n** + 1 (*warning*)

A solution has been computed, but **rcond** is less than *machine precision* so that the matrix A is numerically singular.

ifail = -1

On entry, **uplo** not one of 'U' or 'u' or 'L' or 'l'.

ifail = -2

Constraint: **n** ≥ 0.

ifail = -3

Constraint: **nrhs_p** ≥ 0.

ifail = -5

Constraint: $lda \geq \max(1, \mathbf{n})$.

ifail = -8

Constraint: $ldb \geq \max(1, \mathbf{n})$.

ifail = -99

An unexpected error has been triggered by this routine. Please contact NAG.

ifail = -399

Your licence key may have expired or may not have been installed correctly.

ifail = -999

Dynamic memory allocation failed.

*The integer allocatable memory required is **n**, and the double allocatable memory required is $\max(2 \times \mathbf{n}, \mathbf{lwork})$, where **lwork** is the optimum workspace required by `nag_lapack_dsysv` (f07ma). If this failure occurs it may be possible to solve the equations by calling the packed storage version of `nag_linsys_real_symm_solve` (f04bh), `nag_linsys_real_symm_packed_solve` (f04bj), or by calling `nag_lapack_dsysv` (f07ma) directly with less than the optimum workspace (see Chapter F07).*

7 Accuracy

The computed solution for a single right-hand side, \hat{x} , satisfies an equation of the form

$$(A + E)\hat{x} = b,$$

where

$$\|E\|_1 = O(\epsilon)\|A\|_1$$

and ϵ is the *machine precision*. An approximate error bound for the computed solution is given by

$$\frac{\|\hat{x} - x\|_1}{\|x\|_1} \leq \kappa(A) \frac{\|E\|_1}{\|A\|_1},$$

where $\kappa(A) = \|A^{-1}\|_1 \|A\|_1$, the condition number of A with respect to the solution of the linear equations. `nag_linsys_real_symm_solve` (f04bh) uses the approximation $\|E\|_1 = \epsilon \|A\|_1$ to estimate `errbnd`. See Section 4.4 of Anderson *et al.* (1999) for further details.

8 Further Comments

The total number of floating-point operations required to solve the equations $AX = B$ is proportional to $(\frac{1}{3}n^3 + 2n^2r)$. The condition number estimation typically requires between four and five solves and never more than eleven solves, following the factorization.

In practice the condition number estimator is very reliable, but it can underestimate the true condition number; see Section 15.3 of Higham (2002) for further details.

The complex analogues of `nag_linsys_real_symm_solve` (f04bh) are `nag_linsys_complex_herm_solve` (f04ch) for complex Hermitian matrices, and `nag_linsys_complex_symm_solve` (f04dh) for complex symmetric matrices.

9 Example

This example solves the equations

$$AX = B,$$

where A is the symmetric indefinite matrix

$$A = \begin{pmatrix} -1.81 & 2.06 & 0.63 & -1.15 \\ 2.06 & 1.15 & 1.87 & 4.20 \\ 0.63 & 1.87 & -0.21 & 3.87 \\ -1.15 & 4.20 & 3.87 & 2.07 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 0.96 & 3.93 \\ 6.07 & 19.25 \\ 8.38 & 9.90 \\ 9.50 & 27.85 \end{pmatrix}.$$

An estimate of the condition number of A and an approximate error bound for the computed solutions are also printed.

9.1 Program Text

```
function f04bh_example
fprintf('f04bh example results\n\n');

% Solve Ax = b for symmetric A with error bound and condition number
uplo = 'Upper';
a = [-1.81, 2.06, 0.63, -1.15;
      0, 1.15, 1.87, 4.20;
      0, 0, -0.21, 3.87;
      0, 0, 0, 2.07];
b = [ 0.96, 3.93;
      6.07, 19.25;
      8.38, 9.90;
      9.50, 27.85];

[a, ipiv, x, rcond, errbnd, ifail] = ...
```

```
f04bh(uplo, a, b);  
  
disp('Solution');  
disp(x);  
disp('Estimate of condition number');  
fprintf('%10.1f\n\n',1/rcond);  
disp('Estimate of error bound for computed solutions');  
fprintf('%10.1e\n\n',errbnd);
```
