

## NAG Toolbox

### nag\_lapack\_dgerqf (f08ch)

#### 1 Purpose

nag\_lapack\_dgerqf (f08ch) computes an RQ factorization of a real  $m$  by  $n$  matrix  $A$ .

#### 2 Syntax

```
[a, tau, info] = nag_lapack_dgerqf(a, 'm', m, 'n', n)
```

```
[a, tau, info] = f08ch(a, 'm', m, 'n', n)
```

#### 3 Description

nag\_lapack\_dgerqf (f08ch) forms the  $RQ$  factorization of an arbitrary rectangular real  $m$  by  $n$  matrix. If  $m \leq n$ , the factorization is given by

$$A = \begin{pmatrix} 0 & R \end{pmatrix} Q,$$

where  $R$  is an  $m$  by  $m$  lower triangular matrix and  $Q$  is an  $n$  by  $n$  orthogonal matrix. If  $m > n$  the factorization is given by

$$A = RQ,$$

where  $R$  is an  $m$  by  $n$  upper trapezoidal matrix and  $Q$  is again an  $n$  by  $n$  orthogonal matrix. In the case where  $m < n$  the factorization can be expressed as

$$A = \begin{pmatrix} 0 & R \end{pmatrix} \begin{pmatrix} Q_1 \\ Q_2 \end{pmatrix} = RQ_2,$$

where  $Q_1$  consists of the first  $(n - m)$  rows of  $Q$  and  $Q_2$  the remaining  $m$  rows.

The matrix  $Q$  is not formed explicitly, but is represented as a product of  $\min(m, n)$  elementary reflectors (see the F08 Chapter Introduction for details). Functions are provided to work with  $Q$  in this representation (see Section 9).

#### 5 Parameters

##### 5.1 Compulsory Input Parameters

1: **a**(lda,:) – REAL (KIND=nag\_wp) array

The first dimension of the array **a** must be at least  $\max(1, \mathbf{m})$ .

The second dimension of the array **a** must be at least  $\max(1, \mathbf{n})$ .

The  $m$  by  $n$  matrix  $A$ .

## 5.2 Optional Input Parameters

1: **m** – INTEGER

*Default:* the first dimension of the array **a**.

$m$ , the number of rows of the matrix  $A$ .

*Constraint:*  $m \geq 0$ .

2: **n** – INTEGER

*Default:* the second dimension of the array **a**.

$n$ , the number of columns of the matrix  $A$ .

*Constraint:*  $n \geq 0$ .

## 5.3 Output Parameters

1: **a**(*lda*, :) – REAL (KIND=nag\_wp) array

The first dimension of the array **a** will be  $\max(1, \mathbf{m})$ .

The second dimension of the array **a** will be  $\max(1, \mathbf{n})$ .

If  $m \leq n$ , the upper triangle of the subarray **a**(1 :  $m$ ,  $n - m + 1 : n$ ) contains the  $m$  by  $m$  upper triangular matrix  $R$ .

If  $m \geq n$ , the elements on and above the  $(m - n)$ th subdiagonal contain the  $m$  by  $n$  upper trapezoidal matrix  $R$ ; the remaining elements, with the array **tau**, represent the orthogonal matrix  $Q$  as a product of  $\min(m, n)$  elementary reflectors (see Section 3.2.6 in the F08 Chapter Introduction).

2: **tau**(:) – REAL (KIND=nag\_wp) array

The dimension of the array **tau** will be  $\max(1, \min(\mathbf{m}, \mathbf{n}))$

The scalar factors of the elementary reflectors.

3: **info** – INTEGER

**info** = 0 unless the function detects an error (see Section 6).

## 6 Error Indicators and Warnings

**info** =  $-i$

If **info** =  $-i$ , parameter  $i$  had an illegal value on entry. The parameters are numbered as follows:

1: **m**, 2: **n**, 3: **a**, 4: **lda**, 5: **tau**, 6: **work**, 7: **lwork**, 8: **info**.

It is possible that **info** refers to a parameter that is omitted from the MATLAB interface. This usually indicates that an error in one of the other input parameters has caused an incorrect value to be inferred.

## 7 Accuracy

The computed factorization is the exact factorization of a nearby matrix  $A + E$ , where

$$\|E\|_2 = O\epsilon \|A\|_2$$

and  $\epsilon$  is the *machine precision*.

## 8 Further Comments

The total number of floating-point operations is approximately  $\frac{2}{3}m^2(3n - m)$  if  $m \leq n$ , or  $\frac{2}{3}n^2(3m - n)$  if  $m > n$ .

To form the orthogonal matrix  $Q$  `nag_lapack_dgerqf` (f08ch) may be followed by a call to `nag_lapack_dorgqr` (f08cj):

```
[a, info] = f08cj(a, tau);
```

but note that the first dimension of the array **a** must be at least **n**, which may be larger than was required by `nag_lapack_dgerqf` (f08ch). When  $m \leq n$ , it is often only the first  $m$  rows of  $Q$  that are required and they may be formed by the call:

```
[a, info] = f08cj(a(1:m,1:n), tau);
```

To apply  $Q$  to an arbitrary real rectangular matrix  $C$ , `nag_lapack_dgerqf` (f08ch) may be followed by a call to `nag_lapack_dormrq` (f08ck). For example:

```
[a, c, info] = f08ck('Left', 'Transpose', a, tau, c);
```

forms  $C = Q^T C$ , where  $C$  is  $n$  by  $p$ .

The complex analogue of this function is `nag_lapack_zgerqf` (f08cv).

## 9 Example

This example finds the minimum norm solution to the underdetermined equations

$$Ax = b$$

where

$$A = \begin{pmatrix} -5.42 & 3.28 & -3.68 & 0.27 & 2.06 & 0.46 \\ -1.65 & -3.40 & -3.20 & -1.03 & -4.06 & -0.01 \\ -0.37 & 2.35 & 1.90 & 4.31 & -1.76 & 1.13 \\ -3.15 & -0.11 & 1.99 & -2.70 & 0.26 & 4.50 \end{pmatrix} \quad \text{and} \quad b = \begin{pmatrix} -2.87 \\ 1.63 \\ -3.52 \\ 0.45 \end{pmatrix}.$$

The solution is obtained by first obtaining an  $RQ$  factorization of the matrix  $A$ .

Note that the block size (NB) of 64 assumed in this example is not realistic for such a small problem, but should be suitable for large problems.

### 9.1 Program Text

```
function f08ch_example
fprintf('f08ch example results\n\n');

a = [-5.42, 3.28, -3.68, 0.27, 2.06, 0.46;
     -1.65, -3.40, -3.20, -1.03, -4.06, -0.01;
     -0.37, 2.35, 1.90, 4.31, -1.76, 1.13;
     -3.15, -0.11, 1.99, -2.70, 0.26, 4.50];
b = [-2.87; 1.63; -3.52; 0.45];
% Compute the RQ factorization of a
[a, tau, info] = f08ch(a);

% Solve R*y2 = b
c = zeros(6,1);
[c(3:6), info] = f07te( ...
    'Upper', 'No transpose', 'Non-Unit', a(:, 3:6), b);

if (info > 0)
    fprintf('The upper triangular factor, R, of A is singular,\n');
    fprintf('the least squares solution could not be computed.\n');
else
    % Compute the minimum-norm solution x = (Q^T)*y
    [a, c, info] = f08ck( ...
```

```
'Left', 'Transpose', a, tau, c);  
    fprintf('Minimum-norm solution\n');  
    disp(transpose(c));  
end
```

## 9.2 Program Results

f08ch example results

```
Minimum-norm solution  
0.2371  -0.4575  -0.0085  -0.5192  0.0239  -0.0543
```
