

## NAG Toolbox

### nag\_lapack\_dstevd (f08jc)

#### 1 Purpose

nag\_lapack\_dstevd (f08jc) computes all the eigenvalues and, optionally, all the eigenvectors of a real symmetric tridiagonal matrix. If the eigenvectors are requested, then it uses a divide-and-conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal–Walker–Kahan variant of the  $QL$  or  $QR$  algorithm.

#### 2 Syntax

```
[d, e, z, info] = nag_lapack_dstevd(job, d, e, 'n', n)
[d, e, z, info] = f08jc(job, d, e, 'n', n)
```

#### 3 Description

nag\_lapack\_dstevd (f08jc) computes all the eigenvalues and, optionally, all the eigenvectors of a real symmetric tridiagonal matrix  $T$ . In other words, it can compute the spectral factorization of  $T$  as

$$T = Z\Lambda Z^T,$$

where  $\Lambda$  is a diagonal matrix whose diagonal elements are the eigenvalues  $\lambda_i$ , and  $Z$  is the orthogonal matrix whose columns are the eigenvectors  $z_i$ . Thus

$$Tz_i = \lambda_i z_i, \quad i = 1, 2, \dots, n.$$

#### 4 References

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

#### 5 Parameters

##### 5.1 Compulsory Input Parameters

1: **job** – CHARACTER(1)

Indicates whether eigenvectors are computed.

**job** = 'N'

Only eigenvalues are computed.

**job** = 'V'

Eigenvalues and eigenvectors are computed.

*Constraint:* **job** = 'N' or 'V'.

2: **d**(:) – REAL (KIND=nag\_wp) array

The dimension of the array **d** must be at least  $\max(1, n)$

The  $n$  diagonal elements of the tridiagonal matrix  $T$ .

3: **e**(:) – REAL (KIND=nag\_wp) array

The dimension of the array **e** must be at least  $\max(1, \mathbf{n})$

The  $n - 1$  off-diagonal elements of the tridiagonal matrix  $T$ . The  $n$ th element of this array is used as workspace.

## 5.2 Optional Input Parameters

1: **n** – INTEGER

*Default:* the first dimension of the array **d** and the second dimension of the array **d**. (An error is raised if these dimensions are not equal.)

$n$ , the order of the matrix  $T$ .

*Constraint:*  $\mathbf{n} \geq 0$ .

## 5.3 Output Parameters

1: **d**(:) – REAL (KIND=nag\_wp) array

The dimension of the array **d** will be  $\max(1, \mathbf{n})$

The eigenvalues of the matrix  $T$  in ascending order.

2: **e**(:) – REAL (KIND=nag\_wp) array

The dimension of the array **e** will be  $\max(1, \mathbf{n})$

**e** is overwritten with intermediate results.

3: **z**(ldz,:) – REAL (KIND=nag\_wp) array

The first dimension,  $ldz$ , of the array **z** will be

if **job** = 'V',  $ldz = \max(1, \mathbf{n})$ ;  
if **job** = 'N',  $ldz = 1$ .

The second dimension of the array **z** will be  $\max(1, \mathbf{n})$  if **job** = 'V' and at least 1 if **job** = 'N'.

If **job** = 'V', **z** stores the orthogonal matrix  $Z$  which contains the eigenvectors of  $T$ .

If **job** = 'N', **z** is not referenced.

4: **info** – INTEGER

**info** = 0 unless the function detects an error (see Section 6).

## 6 Error Indicators and Warnings

**info** =  $-i$

If **info** =  $-i$ , parameter  $i$  had an illegal value on entry. The parameters are numbered as follows:

1: **job**, 2: **n**, 3: **d**, 4: **e**, 5: **z**, 6: **ldz**, 7: **work**, 8: **lwork**, 9: **iwork**, 10: **liwork**, 11: **info**.

It is possible that **info** refers to a parameter that is omitted from the MATLAB interface. This usually indicates that an error in one of the other input parameters has caused an incorrect value to be inferred.

**info** > 0

if **info** =  $i$  and **job** = 'N', the algorithm failed to converge;  $i$  elements of an intermediate tridiagonal form did not converge to zero; if **info** =  $i$  and **job** = 'V', then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and column  $i/(\mathbf{n} + 1)$  through  $i \bmod (\mathbf{n} + 1)$ .

## 7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix  $(T + E)$ , where

$$\|E\|_2 = O(\epsilon)\|T\|_2,$$

and  $\epsilon$  is the *machine precision*.

If  $\lambda_i$  is an exact eigenvalue and  $\tilde{\lambda}_i$  is the corresponding computed value, then

$$|\tilde{\lambda}_i - \lambda_i| \leq c(n)\epsilon\|T\|_2,$$

where  $c(n)$  is a modestly increasing function of  $n$ .

If  $z_i$  is the corresponding exact eigenvector, and  $\tilde{z}_i$  is the corresponding computed eigenvector, then the angle  $\theta(\tilde{z}_i, z_i)$  between them is bounded as follows:

$$\theta(\tilde{z}_i, z_i) \leq \frac{c(n)\epsilon\|T\|_2}{\min_{i \neq j} |\lambda_i - \lambda_j|}.$$

Thus the accuracy of a computed eigenvector depends on the gap between its eigenvalue and all the other eigenvalues.

## 8 Further Comments

There is no complex analogue of this function.

## 9 Example

This example computes all the eigenvalues and eigenvectors of the symmetric tridiagonal matrix  $T$ , where

$$T = \begin{pmatrix} 1.0 & 1.0 & 0.0 & 0.0 \\ 1.0 & 4.0 & 2.0 & 0.0 \\ 0.0 & 2.0 & 9.0 & 3.0 \\ 0.0 & 0.0 & 3.0 & 16.0 \end{pmatrix}.$$

### 9.1 Program Text

```
function f08jc_example
fprintf('f08jc example results\n\n');

% Symmetric tridiagonal A stored as diagonal and off-diagonal
n = 4;
d = [1;    4;    9;   16];
e = [1;    2;    3;    0];

% All eigenvalues and eigenvectors of A
job = 'Vectors';
[w, ~, z, info] = f08jc( ...
                    job, d, e);

% Normalize eigenvectors: largest element positive
for j = 1:n
    [~,k] = max(abs(z(:,j)));
    if z(k,j) < 0;
        z(:,j) = -z(:,j);
    end
end

disp(' Eigenvalues:');
disp(w');
disp(' Eigenvectors:');
disp(z);
```

## 9.2 Program Results

f08jc example results

Eigenvalues:
