

NAG Toolbox

nag_sparseig_real_symm_band_init (f12ff)

1 Purpose

nag_sparseig_real_symm_band_init (f12ff) is a setup function for nag_sparseig_real_symm_band_solve (f12fg) which can be used to find some eigenvalues (and optionally the corresponding eigenvectors) of a standard or generalized eigenvalue problem defined by real, banded, symmetric matrices. The banded matrix must be stored using the LAPACK storage format for real banded nonsymmetric matrices.

2 Syntax

```
[icomm, comm, ifail] = nag_sparseig_real_symm_band_init(n, nev, ncv)
[icomm, comm, ifail] = f12ff(n, nev, ncv)
```

3 Description

The pair of functions nag_sparseig_real_symm_band_init (f12ff) and nag_sparseig_real_symm_band_solve (f12fg) together with the option setting function nag_sparseig_real_symm_option (f12fd) are designed to calculate some of the eigenvalues, λ , (and optionally the corresponding eigenvectors, x) of a standard eigenvalue problem $Ax = \lambda x$, or of a generalized eigenvalue problem $Ax = \lambda Bx$ of order n , where n is large and the coefficient matrices A and B are banded real and symmetric.

nag_sparseig_real_symm_band_init (f12ff) is a setup function which must be called before the option setting function nag_sparseig_real_symm_option (f12fd) and the solver function nag_sparseig_real_symm_band_solve (f12fg). Internally, nag_sparseig_real_symm_band_solve (f12fg) makes calls to nag_sparseig_real_symm_iter (f12fb) and nag_sparseig_real_symm_proc (f12fc); the function documents for nag_sparseig_real_symm_iter (f12fb) and nag_sparseig_real_symm_proc (f12fc) should be consulted for details of the algorithm used.

This setup function initializes the communication arrays, sets (to their default values) all options that can be set by you via the option setting function nag_sparseig_real_symm_option (f12fd), and checks that the lengths of the communication arrays as passed by you are of sufficient length. For details of the options available and how to set them, see Section 11.1 in nag_sparseig_real_symm_option (f12fd).

5 Parameters

5.1 Compulsory Input Parameters

1: **n** – INTEGER

The order of the matrix A (and the order of the matrix B for the generalized problem) that defines the eigenvalue problem.

Constraint: $n > 0$.

2: **nev** – INTEGER

The number of eigenvalues to be computed.

Constraint: $0 < nev < n - 1$.

3: **ncv** – INTEGER

The number of Lanczos basis vectors to use during the computation.

At present there is no *a priori* analysis to guide the selection of **ncv** relative to **nev**. However, it is recommended that $ncv \geq 2 \times nev + 1$. If many problems of the same type are to be solved, you should experiment with increasing **ncv** while keeping **nev** fixed for a given test problem. This will usually decrease the required number of matrix-vector operations but it also increases the work and storage required to maintain the orthogonal basis vectors. The optimal ‘cross-over’ with respect to CPU time is problem dependent and must be determined empirically.

Constraint: $nev < ncv \leq n$.

5.2 Optional Input Parameters

None.

5.3 Output Parameters

1: **icomm**(**max**(1, *licomm*)) – INTEGER array

Contains data to be communicated to `nag_sparseig_real_symm_band_solve (f12fg)`.

2: **comm**(**max**(1, *lcomm*)) – REAL (KIND=`nag_wp`) array

Contains data to be communicated to `nag_sparseig_real_symm_band_solve (f12fg)`.

3: **ifail** – INTEGER

ifail = 0 unless the function detects an error (see Section 5).

6 Error Indicators and Warnings

Errors or warnings detected by the function:

ifail = 1

On entry, $n \leq 0$.

ifail = 2

On entry, $nev \leq 0$.

ifail = 3

On entry, $ncv \leq nev$ or $ncv > n$.

ifail = 4

On entry, $licomm < 140$ and $licomm \neq -1$.

ifail = 5

On entry, $lcomm < 60$ and $lcomm \neq -1$.

ifail = -99

An unexpected error has been triggered by this routine. Please contact NAG.

ifail = -399

Your licence key may have expired or may not have been installed correctly.

ifail = -999

Dynamic memory allocation failed.

7 Accuracy

Not applicable.

8 Further Comments

None.

9 Example

The use of `nag_sparseig_real_symm_band_init` (f12ff) is illustrated by the example program of `nag_sparseig_real_symm_band_solve` (f12fg) (see Section 10 in `nag_sparseig_real_symm_band_solve` (f12fg)).

9.1 Program Text

```
function f12ff_example

fprintf('f12ff example results\n\n');

nx = nag_int(10);
n = nx^2;
nev = nag_int(4);
ncv = nag_int(10);

% Banded matrices and dimensions
kl = nx;
ku = nx;
mb = zeros(2*kl+ku+1,n);
ab = zeros(2*kl+ku+1,n);

% Construct the matrix A in banded form and store in ab.
% Main diagonal of A.
h2 = 1/double((nx+1)*(nx+1));
ab(kl+ku+1,1:n) = 4/h2;

% First sub- and super-diagonal of A.
ab(kl+ku, 1:n) = -1/h2;
ab(kl+ku+2, 1:n) = -1/h2;
ab(kl+ku, 1:nx:n) = 0;
ab(kl+ku+2,nx:nx:n) = 0;
% kl-th subdiagonal and ku-th super-diagonal.
ab(kl+1, nx+1:n) = -1/h2;
ab(2*kl+ku+1,1:n-nx) = -1/h2;

% Solver setup
```

```
[icomm, comm, ifail] = f12ff( ...  
                           n, nev, ncv);  
  
% Solver  
sigma = 0;  
resid = zeros(n,1);  
[nconv, d, z, resid, v, comm, icomm, ifail] = ...  
f12fg( ...  
      kl, ku, ab, mb, sigma, resid, comm, icomm);  
  
fprintf('Largest %d Eigenvalues\n',nconv);  
fprintf('%10.2f\n',d(1:nconv));
```

9.2 Program Results

f12ff example results

```
Largest 4 Eigenvalues  
  891.17  
  919.78  
  919.78  
  948.39
```
