

## NAG Library Function Document

### nag\_ode\_ivp\_rk\_interp (d02pxc)

#### 1 Purpose

nag\_ode\_ivp\_rk\_interp (d02pxc) is a function to compute the solution of a system of ordinary differential equations using interpolation anywhere on an integration step taken by nag\_ode\_ivp\_rk\_onestep (d02pdc).

#### 2 Specification

```
#include <nag.h>
#include <nagd02.h>

void nag_ode_ivp_rk_interp (Integer neq, double twant, Nag_SolDeriv request,
    Integer nwant, double ywant[], double ypwant[],
    void (*f)(Integer neq, double t, const double y[], double yp[],
        Nag_User *comm),
    Nag_ODE_RK *opt, Nag_User *comm, NagError *fail)
```

#### 3 Description

nag\_ode\_ivp\_rk\_interp (d02pxc) and its associated functions (nag\_ode\_ivp\_rk\_setup (d02pvc), nag\_ode\_ivp\_rk\_onestep (d02pdc), nag\_ode\_ivp\_rk\_reset\_tend (d02pwc), nag\_ode\_ivp\_rk\_errass (d02pzc) ) solve the initial value problem for a first order system of ordinary differential equations. The functions, based on Runge–Kutta methods and derived from RKSUITE (Brankin *et al.* (1991)) integrate

$$y' = f(t, y) \quad \text{given} \quad y(t_0) = y_0$$

where  $y$  is the vector of **neq** solution components and  $t$  is the independent variable.

nag\_ode\_ivp\_rk\_onestep (d02pdc) computes the solution at the end of an integration step. Using the information computed on that step nag\_ode\_ivp\_rk\_interp (d02pxc) computes the solution by interpolation at any point on that step. It cannot be used if **method** = Nag\_RK\_7.8 was specified in the call to setup function nag\_ode\_ivp\_rk\_setup (d02pvc).

#### 5 Arguments

- |    |   |              |
|----|---|--------------|
| 1: | <b>neq</b> – Integer  | <i>Input</i> |
|    | <i>On entry:</i> the number of ordinary differential equations in the system.                         |              |
|    | <i>Constraint:</i> <b>neq</b> ≥ 1.  |              |
| 2: | <b>twant</b> – double   | <i>Input</i> |
|    | <i>On entry:</i> the value of the independent variable, $t$ , where a solution is desired.            |              |
| 3: | <b>request</b> – Nag_SolDeriv   | <i>Input</i> |
|    | <i>On entry:</i> determines whether the solution and/or its first derivative are computed as follows: |              |

**request** = Nag\_Sol – compute approximate solution only;

**request** = Nag\_Der – compute approximate first derivative of the solution only;

**request** = Nag\_SolDer – compute both approximate solution and first derivative.

*Constraint:* **request** = Nag\_Sol, Nag\_Der or Nag\_SolDer.

- 4: **nwant** – Integer *Input*  
*On entry:* the number of components of the solution to be computed. The first **nwant** components are evaluated.  
*Constraint:*  $1 \leq \mathbf{nwant} \leq \mathbf{neq}$ .
- 5: **ywant[nwant]** – double *Output*  
*On exit:* an approximation to the first **nwant** components of the solution at **twant** when specified by **request**.
- 6: **ypwant[nwant]** – double *Output*  
*On exit:* an approximation to the first **nwant** components of the first derivative of the solution at **twant** when specified by **request**.
- 7: **f** – function, supplied by the user *External Function*  
**f** must evaluate the functions  $f_i$  (that is the first derivatives  $y'_i$ ) for given values of the arguments  $t, y_i$ . It must be the same procedure as supplied to nag\_ode\_ivp\_rk\_onestep (d02pdc).

The specification of **f** is:

```
void f (Integer neq, double t, const double y[], double yp[],
       Nag_User *comm)
```

1: **neq** – Integer *Input*

*On entry:* the number of differential equations.

2: **t** – double *Input*

*On entry:* the current value of the independent variable,  $t$ .

3: **y[neq]** – const double *Input*

*On entry:* the current values of the dependent variables,  $y_i$  for  $i = 1, 2, \dots, \mathbf{neq}$ .

4: **yp[neq]** – double *Output*

*On exit:* the values of  $f_i$  for  $i = 1, 2, \dots, \mathbf{neq}$ .

5: **comm** – Nag\_User \*

Pointer to a structure of type Nag\_User with the following member:

**p** – Pointer

*On entry/exit:* the pointer **comm**→**p** should be cast to the required type, e.g.,  

```
struct user *s = (struct user *)comm → p,
```

to obtain the original object's address with appropriate type. (See the argument **comm** below.)

- 8: **opt** – Nag\_ODE\_RK \* *Input/Output*  
*On entry:* the structure of type Nag\_ODE\_RK as output from nag\_ode\_ivp\_rk\_onestep (d02pdc). You must not change this structure.

*On exit:* some members of **opt** are changed internally.

9: **comm** – Nag\_User \*

Pointer to a structure of type Nag\_User with the following member:

**p** – Pointer

*On entry/exit:* the pointer **comm**→**p**, of type Pointer, allows you to communicate information to and from **f**. An object of the required type should be declared, e.g., a structure, and its address assigned to the pointer **comm**→**p** by means of a cast to Pointer in the calling program, e.g., `comm.p = (Pointer)&s`. The type pointer will be `void *` with a C compiler that defines `void *` and `char *` otherwise.

10: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_2\_INT\_ARG\_GT

On entry, **nwant** =  $\langle value \rangle$  while **neq** =  $\langle value \rangle$ . These arguments must satisfy **neq**  $\leq$  **nwant**.

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_BAD\_PARAM

On entry, argument **request** had an illegal value.

### NE\_INT\_ARG\_LT

On entry, **nwant** =  $\langle value \rangle$ .  
Constraint: **nwant**  $\geq$  1.

### NE\_MEMORY\_FREED

Internally allocated memory has been freed by a call to `nag_ode_ivp_rk_free` (d02ppc) without a subsequent call to the setup function `nag_ode_ivp_rk_setup` (d02pvc).

### NE\_MISSING\_CALL

Previous call to `nag_ode_ivp_rk_onestep` (d02pdc) has not been made, hence `nag_ode_ivp_rk_interp` (d02pxc) must not be called.

### NE\_NEQ

The value of **neq** supplied is not the same as that given to the setup function `nag_ode_ivp_rk_setup` (d02pvc). **neq** =  $\langle value \rangle$  but the value given to `nag_ode_ivp_rk_setup` (d02pvc) was  $\langle value \rangle$ .

### NE\_PREV\_CALL

The previous call to a function had resulted in a severe error. You must call `nag_ode_ivp_rk_setup` (d02pvc) to start another problem.

### NE\_PREV\_CALL\_INI

The previous call to the function `nag_ode_ivp_rk_onestep` (d02pdc) resulted in a severe error. You must call `nag_ode_ivp_rk_setup` (d02pvc) to start another problem.

## NE\_RK\_INVALID\_CALL

The function to be called as specified in the setup function `nag_ode_ivp_rk_setup` (d02pvc) was `nag_ode_ivp_rk_range` (d02pcc). However the actual call was made to `nag_ode_ivp_rk_interp` (d02pxc). This is not permitted.

## NE\_RK\_PX\_METHOD

Interpolation is not available with `method = Nag_RK_7_8`. Either use `method = Nag_RK_2_3` or `Nag_RK_4_5` for which interpolation is available. Alternatively use `nag_ode_ivp_rk_reset_tend` (d02pwc) to make `nag_ode_ivp_rk_onestep` (d02pdc) step exactly to the points where you want output.

## 7 Accuracy

The computed values will be of a similar accuracy to that computed by `nag_ode_ivp_rk_onestep` (d02pdc).

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

None.

## 10 Example

We solve the equation

$$y'' = -y, \quad y(0) = 0, y'(0) = 1$$

reposed as

$$y_1' = y_2 \quad y_2' = -y_1$$

over the range  $[0, 2\pi]$  with initial conditions  $y_1 = 0.0$  and  $y_2 = 1.0$ . We use relative error control with threshold values of  $1.0e-8$  for each solution component. `nag_ode_ivp_rk_onestep` (d02pdc) is used to integrate the problem one step at a time and `nag_ode_ivp_rk_interp` (d02pxc) is used to compute the first component of the solution and its derivative at intervals of length  $\pi/8$  across the range whenever these points lie in one of those integration steps. We use a moderate order Runge–Kutta method (`method = Nag_RK_4_5`) with tolerances `tol = 1.0e-3` and `tol = 1.0e-4` in turn so that we may compare the solutions. The value of  $\pi$  is obtained by using `nag_pi` (X01AAC).
