NAG Library Function Document

nag matop complex gen matrix fun usd (f01fmc)

1 Purpose

nag_matop_complex_gen_matrix_fun_usd (f01fmc) computes the matrix function, f(A), of a complex n by n matrix A, using analytical derivatives of f you have supplied.

2 Specification

3 Description

f(A) is computed using the Schur–Parlett algorithm described in Higham (2008) and Davies and Higham (2003).

The scalar function f, and the derivatives of f, are returned by the function f which, given an integer m, should evaluate $f^{(m)}(z_i)$ at a number of points z_i , for $i=1,2,\ldots,n_z$, on the complex plane. nag_matop_complex_gen_matrix_fun_usd (f01fmc) is therefore appropriate for functions that can be evaluated on the complex plane and whose derivatives, of arbitrary order, can also be evaluated on the complex plane.

5 Arguments

1: **order** – Nag_OrderType

Input

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: order = Nag_RowMajor or Nag_ColMajor.

n - Integer Input

On entry: n, the order of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

3: $\mathbf{a}[dim]$ - Complex

Input/Output

Note: the dimension, dim, of the array **a** must be at least $pda \times n$.

Mark 24 f01fmc.1

f01fmc NAG Library Manual

The (i, j)th element of the matrix A is stored in

```
\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1] when \mathbf{order} = \text{Nag\_ColMajor}; \mathbf{a}[(i-1) \times \mathbf{pda} + j - 1] when \mathbf{order} = \text{Nag\_RowMajor}.
```

On entry: the n by n matrix A.

On exit: the n by n matrix, f(A).

4: **pda** – Integer

Input

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

Constraint: $pda \ge n$.

5: f – function, supplied by the user

External Function

Given an integer m, the function **f** evaluates $f^{(m)}(z_i)$ at a number of points z_i .

The specification of \mathbf{f} is:

1: \mathbf{m} – Integer

Input

On entry: the order, m, of the derivative required.

If $\mathbf{m} = 0$, $f(z_i)$ should be returned. For $\mathbf{m} > 0$, $f^{(m)}(z_i)$ should be returned.

2: **iflag** – Integer *

Input/Output

On entry: iflag will be zero.

On exit: **iflag** should either be unchanged from its entry value of zero, or may be set nonzero to indicate that there is a problem in evaluating the function f(z); for instance $f(z_i)$ may not be defined for a particular z_i . If **iflag** is returned as nonzero then nag_matop_complex_gen_matrix_fun_usd (f01 fmc) will terminate the computation, with **fail.code** = NE USER STOP.

3: **nz** – Integer

Input

On entry: n_z , the number of function or derivative values required.

4: $\mathbf{z}[\mathbf{nz}]$ – const Complex

Input

On entry: the n_z points $z_1, z_2, \ldots, z_{n_z}$ at which the function f is to be evaluated.

5: $\mathbf{fz}[\mathbf{nz}]$ – Complex

Output

On exit: the n_z function or derivative values. $\mathbf{fz}[i-1]$ should return the value $f^{(m)}(z_i)$, for $i=1,2,\ldots,n_z$.

6: **comm** – Nag Comm *

Communication Structure

Pointer to structure of type Nag_Comm; the following members are relevant to f.

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be void *. Before calling nag_matop_complex_gen_matrix_fun_usd (f01fmc) you may allocate memory and initialize these pointers with various quantities for use by **f** when called from

f01fmc.2 Mark 24

nag_matop_complex_gen_matrix_fun_usd (f01fmc) (see Section 3.2.1.1 in the Essential Introduction).

6: **comm** – Nag Comm *

Communication Structure

The NAG communication argument (see Section 3.2.1.1 in the Essential Introduction).

7: **iflag** – Integer *

Output

On exit: iflag = 0, unless iflag has been set nonzero inside f, in which case iflag will be the value set and fail will be set to fail.code = NE USER STOP.

8: **fail** – NagError *

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE ALLOC FAIL

Allocation of memory failed.

NE BAD PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE CONVERGENCE

A Taylor series failed to converge.

NE_INT

```
On entry, \mathbf{n} = \langle value \rangle. Constraint: \mathbf{n} \geq 0.
```

NE_INT_2

```
On entry, \mathbf{pda} = \langle value \rangle and \mathbf{n} = \langle value \rangle.
Constraint: \mathbf{pda} \geq \mathbf{n}.
```

NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected internal error occurred when ordering the eigenvalues of A. Please contact NAG.

The function was unable to compute the Schur decomposition of A.

Note: this failure should not occur and suggests that the function has been called incorrectly.

There was an error whilst reordering the Schur form of A.

Note: this failure should not occur and suggests that the function has been called incorrectly.

NE USER STOP

iflag has been set nonzero by the user.

7 Accuracy

For a normal matrix A (for which $A^{\rm H}A=AA^{\rm H}$), the Schur decomposition is diagonal and the algorithm reduces to evaluating f at the eigenvalues of A and then constructing f(A) using the Schur vectors. This should give a very accurate result. In general, however, no error bounds are available for the algorithm. See Section 9.4 of Higham (2008) for further discussion of the Schur-Parlett algorithm.

f01fmc NAG Library Manual

8 Parallelism and Performance

nag_matop_complex_gen_matrix_fun_usd (f01fmc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_matop_complex_gen_matrix_fun_usd (f01fmc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

In these implementations, this may make calls to the user supplied functions from within an OpenMP parallel region. Thus OpenMP directives within the user functions should be avoided, unless you are using the same OpenMP runtime library (which normally means using the same compiler) as that used to build your NAG Library implementation, as listed in the Installers' Note. You must also ensure that you use the NAG communication argument **comm** in a thread safe manner, which is best achieved by only using it to supply read-only data to the user functions.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

Up to $6n^2$ of Complex allocatable memory is required.

The cost of the Schur-Parlett algorithm depends on the spectrum of A, but is roughly between $28n^3$ and $n^4/3$ floating-point operations. There is an additional cost in evaluating f and its derivatives. If the derivatives of f are not known analytically, then nag_matop_complex_gen_matrix_fun_num (f01flc) can be used to evaluate f(A) using numerical differentiation. If A is complex Hermitian then it is recommended that nag_matop_complex_herm_matrix_fun (f01ffc) be used as it is more efficient and, in general, more accurate than nag matop complex gen matrix fun usd (f01fmc).

Note that f must be analytic in the region of the complex plane containing the spectrum of A.

For further information on matrix functions, see Higham (2008).

If estimates of the condition number of the matrix function are required then nag_matop_complex_gen_matrix_cond_usd (f01kcc) should be used.

nag_matop_real_gen_matrix_fun_usd (f01emc) can be used to find the matrix function f(A) for a real matrix A.

10 Example

This example finds the e^{3A} where

$$A = \begin{pmatrix} 1.0 + 0.0i & 0.0 + 0.0i & 1.0 + 0.0i & 0.0 + 2.0i \\ 0.0 + 1.0i & 1.0 + 0.0i & -1.0 + 0.0i & 1.0 + 0.0i \\ -1.0 + 0.0i & 0.0 + 1.0i & 0.0 + 1.0i & 0.0 + 1.0i \\ 1.0 + 1.0i & 0.0 + 2.0i & -1.0 + 0.0i & 0.0 + 1.0i \end{pmatrix}.$$
