# **NAG Library Function Document**

# nag matop real gen matrix cond exp (f01jgc)

### 1 Purpose

nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) computes an estimate of the relative condition number  $\kappa_{\rm exp}(A)$  of the exponential of a real n by n matrix A, in the 1-norm. The matrix exponential  $e^A$  is also returned.

# 2 Specification

# 3 Description

The Fréchet derivative of the matrix exponential of A is the unique linear mapping  $E \mapsto L(A, E)$  such that for any matrix E

$$e^{A+E} - e^A - L(A, E) = o(||E||).$$

The derivative describes the first-order effect of perturbations in A on the exponential  $e^A$ .

The relative condition number of the matrix exponential can be defined by

$$\kappa_{\exp}(A) = \frac{\|L(A)\| \|A\|}{\|\exp(A)\|},$$

where ||L(A)|| is the norm of the Fréchet derivative of the matrix exponential at A.

To obtain the estimate of  $\kappa_{\exp}(A)$ , nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) first estimates ||L(A)|| by computing an estimate  $\gamma$  of a quantity  $K \in [n^{-1}||L(A)||_1, n||L(A)||_1]$ , such that  $\gamma \leq K$ .

The algorithms used to compute  $\kappa_{\exp}(A)$  are detailed in the Al–Mohy and Higham (2009a) and Al–Mohy and Higham (2009b).

The matrix exponential  $e^A$  is computed using a Padé approximant and the scaling and squaring method. The Padé approximant is differentiated to obtain the Fréchet derivatives  $L\left(A,E\right)$  which are used to estimate the condition number.

# 5 Arguments

1:  $\mathbf{n}$  - Integer Input

On entry: n, the order of the matrix A.

Constraint:  $\mathbf{n} \geq 0$ .

2:  $\mathbf{a}[dim]$  – double

Input/Output

**Note**: the dimension, dim, of the array **a** must be at least  $pda \times n$ .

The (i, j)th element of the matrix A is stored in  $\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1]$ .

On entry: the n by n matrix A.

On exit: the n by n matrix exponential  $e^A$ .

3: **pda** – Integer

Input

On entry: the stride separating matrix row elements in the array a.

 $\textit{Constraint} : \ pda \geq n.$ 

4: **condea** – double \*

Output

On exit: an estimate of the relative condition number of the matrix exponential  $\kappa_{\exp}(A)$ .

5: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

# 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

#### NE\_INT

```
On entry, \mathbf{n} = \langle value \rangle.
Constraint: \mathbf{n} \geq 0.
```

#### NE INT 2

```
On entry, \mathbf{pda} = \langle value \rangle and \mathbf{n} = \langle value \rangle.
Constraint: \mathbf{pda} \geq \mathbf{n}.
```

# NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### **NE\_SINGULAR**

The linear equations to be solved for the Padé approximant are singular; it is likely that this function has been called incorrectly.

### NW SOME PRECISION LOSS

 $e^A$  has been computed using an IEEE double precision Padé approximant, although the arithmetic precision is higher than IEEE double precision.

f01jgc.2 Mark 24

## 7 Accuracy

nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) uses the norm estimation function nag\_linsys\_real\_gen\_norm\_rcomm (f04ydc) to produce an estimate  $\gamma$  of a quantity  $K \in [n^{-1}||L(A)||_1, n||L(A)||_1]$ , such that  $\gamma \leq K$ . For further details on the accuracy of norm estimation, see the documentation for nag linsys real gen norm rcomm (f04ydc).

For a normal matrix A (for which  $A^{T}A = AA^{T}$ ) the computed matrix,  $e^{A}$ , is guaranteed to be close to the exact matrix, that is, the method is forward stable. No such guarantee can be given for non-normal matrices. See Section 10.3 of Higham (2008) for details and further discussion.

For further discussion of the condition of the matrix exponential see Section 10.2 of Higham (2008).

#### 8 Parallelism and Performance

nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

### 9 Further Comments

nag\_matop\_real\_gen\_matrix\_cond\_std (f01jac) uses a similar algorithm to nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) to compute an estimate of the *absolute* condition number (which is related to the relative condition number by a factor of  $||A||/||\exp(A)||$ ). However, the required Fréchet derivatives are computed in a more efficient and stable manner by nag\_matop\_real\_gen\_matrix\_cond\_exp (f01jgc) and so its use is recommended over nag matop real gen matrix cond std (f01jac).

The cost of the algorithm is  $O(n^3)$  and the real allocatable memory required is approximately  $15n^2$ ; see Al-Mohy and Higham (2009a) and Al-Mohy and Higham (2009b) for further details.

If the matrix exponential alone is required, without an estimate of the condition number, then nag\_real\_gen\_matrix\_exp (f01ecc) should be used. If the Fréchet derivative of the matrix exponential is required then nag matop real gen matrix freht exp (f01jhc) should be used.

As well as the excellent book Higham (2008), the classic reference for the computation of the matrix exponential is Moler and Van Loan (2003).

## 10 Example

This example estimates the relative condition number of the matrix exponential  $e^A$ , where

$$A = \begin{pmatrix} 2 & 2 & 1 & 2 \\ 3 & 1 & 4 & 0 \\ 2 & 3 & 1 & 2 \\ 0 & 1 & 3 & 3 \end{pmatrix}.$$
