

NAG Library Function Document

nag_dgeequ (f07afc)

1 Purpose

nag_dgeequ (f07afc) computes diagonal scaling matrices D_R and D_C intended to equilibrate a real m by n matrix A and reduce its condition number.

2 Specification

```
#include <nag.h>
#include <nagf07.h>

void nag_dgeequ (Nag_OrderType order, Integer m, Integer n, const double a[],
                Integer pda, double r[], double c[], double *rowcnd, double *colcnd,
                double *amax, NagError *fail)
```

3 Description

nag_dgeequ (f07afc) computes the diagonal scaling matrices. The diagonal scaling matrices are chosen to try to make the elements of largest absolute value in each row and column of the matrix B given by

$$B = D_R A D_C$$

have absolute value 1. The diagonal elements of D_R and D_C are restricted to lie in the safe range $(\delta, 1/\delta)$, where δ is the value returned by function nag_real_safe_small_number (X02AMC). Use of these scaling factors is not guaranteed to reduce the condition number of A but works well in practice.

4 References

None.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **m** – Integer *Input*
On entry: m , the number of rows of the matrix A .
Constraint: **m** ≥ 0 .
- 3: **n** – Integer *Input*
On entry: n , the number of columns of the matrix A .
Constraint: **n** ≥ 0 .

- 4: **a**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **a** must be at least
 $\max(1, \mathbf{pda} \times \mathbf{n})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{m} \times \mathbf{pda})$ when **order** = Nag_RowMajor.
The (*i*, *j*)th element of the matrix *A* is stored in
 $\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1]$ when **order** = Nag_ColMajor;
 $\mathbf{a}[(i-1) \times \mathbf{pda} + j - 1]$ when **order** = Nag_RowMajor.
On entry: the matrix *A* whose scaling factors are to be computed.
- 5: **pda** – Integer *Input*
On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.
Constraints:
if **order** = Nag_ColMajor, **pda** $\geq \max(1, \mathbf{m})$;
if **order** = Nag_RowMajor, **pda** $\geq \max(1, \mathbf{n})$.
- 6: **r**[**m**] – double *Output*
On exit: if **fail.code** = NE_NOERROR or **fail.code** = NE_MAT_COL_ZERO, **r** contains the row scale factors, the diagonal elements of D_R . The elements of **r** will be positive.
- 7: **c**[**n**] – double *Output*
On exit: if **fail.code** = NE_NOERROR, **c** contains the column scale factors, the diagonal elements of D_C . The elements of **c** will be positive.
- 8: **rowcnd** – double * *Output*
On exit: if **fail.code** = NE_NOERROR or **fail.code** = NE_MAT_COL_ZERO, **rowcnd** contains the ratio of the smallest value of $\mathbf{r}[i-1]$ to the largest value of $\mathbf{r}[i-1]$. If **rowcnd** ≥ 0.1 and **amax** is neither too large nor too small, it is not worth scaling by D_R .
- 9: **colcnd** – double * *Output*
On exit: if **fail.code** = NE_NOERROR, **colcnd** contains the ratio of the smallest value of $\mathbf{c}[i-1]$ to the largest value of $\mathbf{c}[i-1]$.
If **colcnd** ≥ 0.1 , it is not worth scaling by D_C .
- 10: **amax** – double * *Output*
On exit: $\max |a_{ij}|$. If **amax** is very close to overflow or underflow, the matrix *A* should be scaled.
- 11: **fail** – NagError * *Input/Output*
The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **m** = $\langle value \rangle$.
Constraint: **m** ≥ 0 .

On entry, **n** = $\langle value \rangle$.
Constraint: **n** ≥ 0 .

On entry, **pda** = $\langle value \rangle$.
Constraint: **pda** > 0 .

NE_INT_2

On entry, **pda** = $\langle value \rangle$ and **m** = $\langle value \rangle$.
Constraint: **pda** $\geq \max(1, \mathbf{m})$.

On entry, **pda** = $\langle value \rangle$ and **n** = $\langle value \rangle$.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_MAT_COL_ZERO

The $\langle value \rangle$ column of A is exactly zero.

NE_MAT_ROW_ZERO

The $\langle value \rangle$ row of A is exactly zero.

7 Accuracy

The computed scale factors will be close to the exact scale factors.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The complex analogue of this function is nag_zgeequ (f07atc).

10 Example

This example equilibrates the general matrix A given by

$$A = \begin{pmatrix} 1.80 \times 10^{10} & 2.88 \times 10^{10} & 2.05 & -8.90 \times 10^9 \\ 5.25 & -2.95 & -9.50 \times 10^{-9} & -3.80 \\ 1.58 & -2.69 & -2.90 \times 10^{-10} & -1.04 \\ -1.11 & -0.66 & -5.90 \times 10^{-11} & 0.80 \end{pmatrix}.$$

Details of the scaling factors, and the scaled matrix are output.
