NAG Library Function Document

nag_zhptri (f07pwc)

1 Purpose

nag_zhptri (f07pwc) computes the inverse of a complex Hermitian indefinite matrix A, where A has been factorized by nag_zhptrf (f07prc), using packed storage.

2 Specification

```
#include <nag.h>
#include <nagf07.h>
```

```
void nag_zhptri (Nag_OrderType order, Nag_UploType uplo, Integer n,
     Complex ap[], const Integer ipiv[], NagError *fail)
```

3 Description

nag_zhptri (f07pwc) is used to compute the inverse of a complex Hermitian indefinite matrix A, the function must be preceded by a call to nag_zhptrf (f07prc), which computes the Bunch–Kaufman factorization of A, using packed storage.

If **uplo** = Nag_Upper, $A = PUDU^{\mathrm{H}}P^{\mathrm{T}}$ and A^{-1} is computed by solving $U^{\mathrm{H}}P^{\mathrm{T}}XPU = D^{-1}$ for X.

If **uplo** = Nag_Lower, $A = PLDL^{\mathrm{H}}P^{\mathrm{T}}$ and A^{-1} is computed by solving $L^{\mathrm{H}}P^{\mathrm{T}}XPL = D^{-1}$ for X.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UploType *Input*

On entry: specifies how A has been factorized.

uplo = Nag_Upper
$A = PUDU^{\mathrm{H}}P^{\mathrm{T}}$, where U is upper triangular.

uplo = Nag_Lower
$A = PLDL^{\mathrm{H}}P^{\mathrm{T}}$, where L is lower triangular.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3: **n** – Integer *Input*

On entry: n, the order of the matrix A.

Constraint: **n** ≥ 0.

4: **ap**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$.

On entry: the factorization of A stored in packed form, as returned by nag_zhptrf (f07prc).

On exit: the factorization is overwritten by the n by n matrix A^{-1}.

The storage of elements A_{ij} depends on the **order** and **uplo** arguments as follows:

if **order** = 'Nag_ColMajor' and **uplo** = 'Nag_Upper',
A_{ij} is stored in $\mathbf{ap}[(j-1) \times j/2 + i - 1]$, for $i \leq j$;
if **order** = 'Nag_ColMajor' and **uplo** = 'Nag_Lower',
A_{ij} is stored in $\mathbf{ap}[(2n-j) \times (j-1)/2 + i - 1]$, for $i \geq j$;
if **order** = 'Nag_RowMajor' and **uplo** = 'Nag_Upper',
A_{ij} is stored in $\mathbf{ap}[(2n-i) \times (i-1)/2 + j - 1]$, for $i \leq j$;
if **order** = 'Nag_RowMajor' and **uplo** = 'Nag_Lower',
A_{ij} is stored in $\mathbf{ap}[(i-1) \times i/2 + j - 1]$, for $i \geq j$.

5: **ipiv**[*dim*] – const Integer *Input*

Note: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.

On entry: details of the interchanges and the block structure of D, as returned by nag_zhptrf (f07prc).

6: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, $\mathbf{n} = \langle\mathit{value}\rangle$.
Constraint: $\mathbf{n} \geq 0$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_SINGULAR

$d(\langle\mathit{value}\rangle, \langle\mathit{value}\rangle)$ is exactly zero. D is singular and the inverse of A cannot be computed.

7 Accuracy

The computed inverse X satisfies a bound of the form

if **uplo** = Nag_Upper, $|DU^{\mathrm{T}}P^{\mathrm{T}}XPU - I| \leq c(n)\epsilon\big(|D||U^{\mathrm{T}}|P^{\mathrm{T}}|X|P|U| + |D||D^{-1}|\big)$;

if **uplo** = Nag_Lower, $|DL^{\mathrm{T}}P^{\mathrm{T}}XPL - I| \leq c(n)\epsilon\big(|D||L^{\mathrm{T}}|P^{\mathrm{T}}|X|P|L| + |D||D^{-1}|\big)$,

$c(n)$ is a modest linear function of n, and ϵ is the ***machine precision***.

8 Parallelism and Performance

nag_zhptri (f07pwc) is not threaded by NAG in any implementation.

nag_zhptri (f07pwc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations is approximately $\frac{8}{3}n^3$.

The real analogue of this function is nag_dsptri (f07pjc).

10 Example

This example computes the inverse of the matrix A, where

$$A = \begin{pmatrix} -1.36+0.00i & 1.58+0.90i & 2.21-0.21i & 3.91+1.50i \\ 1.58-0.90i & -8.87+0.00i & -1.84-0.03i & -1.78+1.18i \\ 2.21+0.21i & -1.84+0.03i & -4.63+0.00i & 0.11+0.11i \\ 3.91-1.50i & -1.78-1.18i & 0.11-0.11i & -1.84+0.00i \end{pmatrix}.$$

Here A is Hermitian indefinite, stored in packed form, and must first be factorized by nag_zhptrf (f07prc).
