

NAG Library Function Document

nag_dspevd (f08gcc)

1 Purpose

nag_dspevd (f08gcc) computes all the eigenvalues and, optionally, all the eigenvectors of a real symmetric matrix held in packed storage. If the eigenvectors are requested, then it uses a divide-and-conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal–Walker–Kahan variant of the QL or QR algorithm.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dspevd (Nag_OrderType order, Nag_JobType job, Nag_UptoType uplo,
                 Integer n, double ap[], double w[], double z[], Integer pdz,
                 NagError *fail)
```

3 Description

nag_dspevd (f08gcc) computes all the eigenvalues and, optionally, all the eigenvectors of a real symmetric matrix A (held in packed storage). In other words, it can compute the spectral factorization of A as

$$A = Z\Lambda Z^T,$$

where Λ is a diagonal matrix whose diagonal elements are the eigenvalues λ_i , and Z is the orthogonal matrix whose columns are the eigenvectors z_i . Thus

$$Az_i = \lambda_i z_i, \quad i = 1, 2, \dots, n.$$

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

On exit: if **job** = Nag_EigVecs, **z** is overwritten by the orthogonal matrix Z which contains the eigenvectors of A .

If **job** = Nag_DoNothing, **z** is not referenced.

8: **pdz** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **z**.

Constraints:

if **job** = Nag_EigVecs, **pdz** $\geq \max(1, n)$;
 if **job** = Nag_DoNothing, **pdz** ≥ 1 .

9: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_CONVERGENCE

If **fail.errnum** = $\langle value \rangle$ and **job** = Nag_DoNothing, the algorithm failed to converge; $\langle value \rangle$ elements of an intermediate tridiagonal form did not converge to zero; if **fail.errnum** = $\langle value \rangle$ and **job** = Nag_EigVecs, then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and column $\langle value \rangle / (n + 1)$ through $\langle value \rangle \bmod (n + 1)$.

NE_ENUM_INT_2

On entry, **job** = $\langle value \rangle$, **pdz** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: if **job** = Nag_EigVecs, **pdz** $\geq \max(1, n)$;
 if **job** = Nag_DoNothing, **pdz** ≥ 1 .

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **pdz** = $\langle value \rangle$.

Constraint: **pdz** > 0 .

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the *machine precision*. See Section 4.7 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

`nag_dspevd` (f08gcc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_dspevd` (f08gcc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The complex analogue of this function is nag_zhpevd (f08gqc).

10 Example

This example computes all the eigenvalues and eigenvectors of the symmetric matrix A , where

$$A = \begin{pmatrix} 1.0 & 2.0 & 3.0 & 4.0 \\ 2.0 & 2.0 & 3.0 & 4.0 \\ 3.0 & 3.0 & 3.0 & 4.0 \\ 4.0 & 4.0 & 4.0 & 4.0 \end{pmatrix}.$$
