

NAG Library Function Document

nag_zupgtr (f08gtc)

1 Purpose

nag_zupgtr (f08gtc) generates the complex unitary matrix Q , which was determined by nag_zhptrd (f08gsc) when reducing a Hermitian matrix to tridiagonal form.

2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zupgtr (Nag_OrderType order, Nag_UploType uplo, Integer n,
                 const Complex ap[], const Complex tau[], Complex q[], Integer pdq,
                 NagError *fail)
```

3 Description

nag_zupgtr (f08gtc) is intended to be used after a call to nag_zhptrd (f08gsc), which reduces a complex Hermitian matrix A to real symmetric tridiagonal form T by a unitary similarity transformation: $A = QTQ^H$. nag_zhptrd (f08gsc) represents the unitary matrix Q as a product of $n - 1$ elementary reflectors.

This function may be used to generate Q explicitly as a square matrix.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **uplo** – Nag_UploType *Input*
On entry: this **must** be the same argument **uplo** as supplied to nag_zhptrd (f08gsc).
Constraint: **uplo** = Nag_Upper or Nag_Lower.
- 3: **n** – Integer *Input*
On entry: n , the order of the matrix Q .
Constraint: $n \geq 0$.
- 4: **ap**[*dim*] – const Complex *Input*
Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.

On entry: details of the vectors which define the elementary reflectors, as returned by nag_zhptrd (f08gsc).

5: **tau**[*dim*] – const Complex *Input*

Note: the dimension, *dim*, of the array **tau** must be at least $\max(1, \mathbf{n} - 1)$.

On entry: further details of the elementary reflectors, as returned by nag_zhptrd (f08gsc).

6: **q**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **q** must be at least $\max(1, \mathbf{pdq} \times \mathbf{n})$.

The (*i*, *j*)th element of the matrix *Q* is stored in

$$\begin{aligned} & \mathbf{q}[(j-1) \times \mathbf{pdq} + i - 1] \text{ when } \mathbf{order} = \text{Nag_ColMajor}; \\ & \mathbf{q}[(i-1) \times \mathbf{pdq} + j - 1] \text{ when } \mathbf{order} = \text{Nag_RowMajor}. \end{aligned}$$

On exit: the *n* by *n* unitary matrix *Q*.

7: **pdq** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **q**.

Constraint: $\mathbf{pdq} \geq \max(1, \mathbf{n})$.

8: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument *<value>* had an illegal value.

NE_INT

On entry, **n** = *<value>*.

Constraint: $\mathbf{n} \geq 0$.

On entry, **pdq** = *<value>*.

Constraint: $\mathbf{pdq} > 0$.

NE_INT_2

On entry, **pdq** = *<value>* and **n** = *<value>*.

Constraint: $\mathbf{pdq} \geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed matrix *Q* differs from an exactly unitary matrix by a matrix *E* such that

$$\|E\|_2 = O(\epsilon),$$

where ϵ is the *machine precision*.

8 Parallelism and Performance

nag_zupgtr (f08gtc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zupgtr (f08gtc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations is approximately $\frac{16}{3}n^3$.

The real analogue of this function is nag_dopgtr (f08gfc).

10 Example

This example computes all the eigenvalues and eigenvectors of the matrix A , where

$$A = \begin{pmatrix} -2.28 + 0.00i & 1.78 - 2.03i & 2.26 + 0.10i & -0.12 + 2.53i \\ 1.78 + 2.03i & -1.12 + 0.00i & 0.01 + 0.43i & -1.07 + 0.86i \\ 2.26 - 0.10i & 0.01 - 0.43i & -0.37 + 0.00i & 2.31 - 0.92i \\ -0.12 - 2.53i & -1.07 - 0.86i & 2.31 + 0.92i & -0.73 + 0.00i \end{pmatrix},$$

using packed storage. Here A is Hermitian and must first be reduced to tridiagonal form by nag_zhptrd (f08gsc). The program then calls nag_zupgtr (f08gtc) to form Q , and passes this matrix to nag_zsteqr (f08jsc) which computes the eigenvalues and eigenvectors of A .
