NAG Library Function Document

nag_dgesvd (f08kbc)

1 Purpose

nag_dgesvd (f08kbc) computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dgesvd (Nag_OrderType order, Nag_ComputeUType jobu,
     Nag_ComputeVTType jobvt, Integer m, Integer n, double a[], Integer pda,
     double s[], double u[], Integer pdu, double vt[], Integer pdvt,
     double work[], NagError *fail)
```

3 Description

The SVD is written as

$$A = U\Sigma V^{\mathrm{T}},$$

where Σ is an m by n matrix which is zero except for its $\min(m,n)$ diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of Σ are the singular values of A; they are real and non-negative, and are returned in descending order. The first $\min(m,n)$ columns of U and V are the left and right singular vectors of A.

Note that the function returns V^{T}, not V.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **jobu** – Nag_ComputeUType *Input*

On entry: specifies options for computing all or part of the matrix U.

jobu = Nag_AllU
All m columns of U are returned in array **u**.

jobu = Nag_SingularVecsU
The first $\min(m,n)$ columns of U (the left singular vectors) are returned in the array **u**.

jobu = Nag_Overwrite
The first $\min(m,n)$ columns of U (the left singular vectors) are overwritten on the array **a**.

jobu = Nag_NotU
No columns of U (no left singular vectors) are computed.

Constraint: **jobu** = Nag_AllU, Nag_SingularVecsU, Nag_Overwrite or Nag_NotU.

3: **jobvt** – Nag_ComputeVTType *Input*

On entry: specifies options for computing all or part of the matrix V^{T}.

jobvt = Nag_AllVT
All n rows of V^{T} are returned in the array **vt**.

jobvt = Nag_SingularVecsVT
The first $\min(m,n)$ rows of V^{T} (the right singular vectors) are returned in the array **vt**.

jobvt = Nag_OverwriteVT
The first $\min(m,n)$ rows of V^{T} (the right singular vectors) are overwritten on the array **a**.

jobvt = Nag_NotVT
No rows of V^{T} (no right singular vectors) are computed.

Constraints:

jobvt = Nag_AllVT, Nag_SingularVecsVT, Nag_OverwriteVT or Nag_NotVT;
If **jobu** = Nag_Overwrite, **jobvt** cannot be Nag_OverwriteVT.

4: **m** – Integer *Input*

On entry: m, the number of rows of the matrix A.

Constraint: $\mathbf{m} \geq 0$.

5: **n** – Integer *Input*

On entry: n, the number of columns of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

6: **a**[dim] – double *Input/Output*

Note: the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{n})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pda})$ when **order** = Nag_RowMajor.

The (i,j)th element of the matrix A is stored in

a$[(j-1) \times \mathbf{pda} + i - 1]$ when **order** = Nag_ColMajor;
a$[(i-1) \times \mathbf{pda} + j - 1]$ when **order** = Nag_RowMajor.

On entry: the m by n matrix A.

On exit: if **jobu** = Nag_Overwrite, **a** is overwritten with the first $\min(m,n)$ columns of U (the left singular vectors, stored column-wise).

If **jobvt** = Nag_OverwriteVT, **a** is overwritten with the first $\min(m,n)$ rows of V^{T} (the right singular vectors, stored row-wise).

If **jobu** $\neq$ Nag_Overwrite and **jobvt** $\neq$ Nag_OverwriteVT, the contents of **a** are destroyed.

7: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

Constraints:

if **order** = Nag_ColMajor, **pda** $\geq \max(1, \mathbf{m})$;
if **order** = Nag_RowMajor, **pda** $\geq \max(1, \mathbf{n})$.

8: **s**[dim] – double *Output*

Note: the dimension, *dim*, of the array **s** must be at least $\max(1, \min(\mathbf{m}, \mathbf{n}))$.

On exit: the singular values of A, sorted so that $\mathbf{s}[i-1] \geq \mathbf{s}[i]$.

9: **u**[dim] – double *Output*

Note: the dimension, *dim*, of the array **u** must be at least

$\max(1, \mathbf{pdu} \times \mathbf{m})$ when **jobu** = Nag_AllU;
$\max(1, \mathbf{pdu} \times \min(\mathbf{m}, \mathbf{n}))$ when **jobu** = Nag_SingularVecsU and **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pdu})$ when **jobu** = Nag_SingularVecsU and **order** = Nag_RowMajor;
1 otherwise.

The (i, j)th element of the matrix U is stored in

$\mathbf{u}[(j-1) \times \mathbf{pdu} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{u}[(i-1) \times \mathbf{pdu} + j - 1]$ when **order** = Nag_RowMajor.

On exit: if **jobu** = Nag_AllU, **u** contains the m by m orthogonal matrix U.

If **jobu** = Nag_SingularVecsU, **u** contains the first $\min(m, n)$ columns of U (the left singular vectors, stored column-wise).

If **jobu** = Nag_NotU or Nag_Overwrite, **u** is not referenced.

10: **pdu** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **u**.

Constraints:

if **order** = Nag_ColMajor,

if **jobu** = Nag_AllU, **pdu** $\geq \max(1, \mathbf{m})$;
if **jobu** = Nag_SingularVecsU, **pdu** $\geq \max(1, \mathbf{m})$;
otherwise **pdu** ≥ 1.;

if **order** = Nag_RowMajor,

if **jobu** = Nag_AllU, **pdu** $\geq \max(1, \mathbf{m})$;
if **jobu** = Nag_SingularVecsU, **pdu** $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
otherwise **pdu** ≥ 1..

11: **vt**[dim] – double *Output*

Note: the dimension, *dim*, of the array **vt** must be at least

$\max(1, \mathbf{pdvt} \times \mathbf{n})$ when **jobvt** = Nag_AllVT;
$\max(1, \mathbf{pdvt} \times \mathbf{n})$ when **jobvt** = Nag_SingularVecsVT and **order** = Nag_ColMajor;
$\max(1, \min(\mathbf{m}, \mathbf{n}) \times \mathbf{pdvt})$ when **jobvt** = Nag_SingularVecsVT and
order = Nag_RowMajor;
1 otherwise.

The (i, j)th element of the matrix is stored in

$\mathbf{vt}[(j-1) \times \mathbf{pdvt} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{vt}[(i-1) \times \mathbf{pdvt} + j - 1]$ when **order** = Nag_RowMajor.

On exit: if **jobvt** = Nag_AllVT, **vt** contains the n by n orthogonal matrix V^{T}.

If **jobvt** = Nag_SingularVecsVT, **vt** contains the first $\min(m,n)$ rows of V^{T} (the right singular vectors, stored row-wise).

If **jobvt** = Nag_NotVT or Nag_OverwriteVT, **vt** is not referenced.

12: **pdvt** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **vt**.

Constraints:

if **order** = Nag_ColMajor,

if **jobvt** = Nag_AllVT, **pdvt** $\geq \max(1,\mathbf{n})$;
if **jobvt** = Nag_SingularVecsVT, **pdvt** $\geq \max(1,\min(\mathbf{m},\mathbf{n}))$;
otherwise **pdvt** ≥ 1.;

if **order** = Nag_RowMajor,

if **jobvt** = Nag_AllVT, **pdvt** $\geq \max(1,\mathbf{n})$;
if **jobvt** = Nag_SingularVecsVT, **pdvt** $\geq \max(1,\mathbf{n})$;
otherwise **pdvt** ≥ 1..

13: **work**[**min**(**m**, **n**)] – double *Output*

On exit: if **fail.code** = NE_CONVERGENCE, **WORK**$(2:\min(\mathbf{m},\mathbf{n}))$ (using the notation described in Section 3.2.1.4 in the Essential Introduction) contains the unconverged superdiagonal elements of an upper bidiagonal matrix B whose diagonal is in **s** (not necessarily sorted). B satisfies $A = UBV^{\mathrm{T}}$, so it has the same singular values as A, and singular vectors related by U and V^{T}.

14: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_CONVERGENCE

If nag_dgesvd (f08kbc) did not converge, **fail.errnum** specifies how many superdiagonals of an intermediate bidiagonal form did not converge to zero.

NE_ENUM_INT_2

On entry, **jobu** = ⟨*value*⟩, **pdu** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: if **jobu** = Nag_AllU, **pdu** $\geq \max(1,\mathbf{m})$;
if **jobu** = Nag_SingularVecsU, **pdu** $\geq \max(1,\mathbf{m})$;
otherwise **pdu** ≥ 1.

NE_ENUM_INT_3

On entry, **jobu** = ⟨*value*⟩, **pdu** = ⟨*value*⟩, **m** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **jobu** = Nag_AllU, **pdu** $\geq \max(1, \mathbf{m})$;
if **jobu** = Nag_SingularVecsU, **pdu** $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
otherwise **pdu** ≥ 1.

On entry, **jobvt** = ⟨*value*⟩, **pdvt** = ⟨*value*⟩, **m** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **jobvt** = Nag_AllVT, **pdvt** $\geq \max(1, \mathbf{n})$;
if **jobvt** = Nag_SingularVecsVT, **pdvt** $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
otherwise **pdvt** ≥ 1.

On entry, **jobvt** = ⟨*value*⟩, **pdvt** = ⟨*value*⟩, **m** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **jobvt** = Nag_AllVT, **pdvt** $\geq \max(1, \mathbf{n})$;
if **jobvt** = Nag_SingularVecsVT, **pdvt** $\geq \max(1, \mathbf{n})$;
otherwise **pdvt** ≥ 1.

NE_INT

On entry, **m** = ⟨*value*⟩.
Constraint: **m** ≥ 0.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** > 0.

On entry, **pdu** = ⟨*value*⟩.
Constraint: **pdu** > 0.

On entry, **pdvt** = ⟨*value*⟩.
Constraint: **pdvt** > 0.

NE_INT_2

On entry, **pda** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{m})$.

On entry, **pda** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed singular value decomposition is nearly the exact singular value decomposition for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the ***machine precision***. In addition, the computed singular vectors are nearly orthogonal to working precision. See Section 4.9 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

nag_dgesvd (f08kbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dgesvd (f08kbc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately proportional to mn^2 when $m > n$ and m^2n otherwise.

The singular values are returned in descending order.

The complex analogue of this function is nag_zgesvd (f08kpc).

10 Example

This example finds the singular values and left and right singular vectors of the 6 by 4 matrix

$$A = \begin{pmatrix} 2.27 & -1.54 & 1.15 & -1.94 \\ 0.28 & -1.67 & 0.94 & -0.78 \\ -0.48 & -3.09 & 0.99 & -0.21 \\ 1.07 & 1.22 & 0.79 & 0.63 \\ -2.35 & 2.93 & -1.45 & 2.30 \\ 0.62 & -7.39 & 1.03 & -2.57 \end{pmatrix},$$

together with approximate error bounds for the computed singular values and vectors.

The example program for nag_dgesdd (f08kdc) illustrates finding a singular value decomposition for the case $m \leq n$.
