# NAG Library Function Document

# nag_zgelsd (f08kqc)

## 1 Purpose

nag_zgelsd (f08kqc) computes the minimum norm solution to a complex linear least squares problem

$$\min_x \|b - Ax\|_2.$$

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zgelsd (Nag_OrderType order, Integer m, Integer n, Integer nrhs,
     Complex a[], Integer pda, Complex b[], Integer pdb, double s[],
     double rcond, Integer *rank, NagError *fail)
```

## 3 Description

nag_zgelsd (f08kqc) uses the singular value decomposition (SVD) of $A$, where $A$ is a complex $m$ by $n$ matrix which may be rank-deficient.

Several right-hand side vectors $b$ and solution vectors $x$ can be handled in a single call; they are stored as the columns of the $m$ by $r$ right-hand side matrix $B$ and the $n$ by $r$ solution matrix $X$.

The problem is solved in three steps:

1. reduce the coefficient matrix $A$ to bidiagonal form with Householder transformations, reducing the original problem into a 'bidiagonal least squares problem' (BLS);
2. solve the BLS using a divide-and-conquer approach;
3. apply back all the Householder transformations to solve the original least squares problem.

The effective rank of $A$ is determined by treating as zero those singular values which are less than **rcond** times the largest singular value.

## 5 Arguments

1: **order** – Nag_OrderType *Input*

*On entry*: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint*: **order** = Nag_RowMajor or Nag_ColMajor.

2: **m** – Integer *Input*

*On entry*: $m$, the number of rows of the matrix $A$.

*Constraint*: $\mathbf{m} \geq 0$.

3: **n** – Integer *Input*

*On entry*: $n$, the number of columns of the matrix $A$.

*Constraint*: $\mathbf{n} \geq 0$.

4: **nrhs** – Integer *Input*

*On entry*: $r$, the number of right-hand sides, i.e., the number of columns of the matrices $B$ and $X$.

*Constraint*: $\mathbf{nrhs} \geq 0$.

5: **a**[$dim$] – Complex *Input/Output*

**Note**: the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{n})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pda})$ when **order** = Nag_RowMajor.

The $(i, j)$th element of the matrix $A$ is stored in

$\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{a}[(i-1) \times \mathbf{pda} + j - 1]$ when **order** = Nag_RowMajor.

*On entry*: the $m$ by $n$ coefficient matrix $A$.

*On exit*: the contents of **a** are destroyed.

6: **pda** – Integer *Input*

*On entry*: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

*Constraints*:

if **order** = Nag_ColMajor, $\mathbf{pda} \geq \max(1, \mathbf{m})$;
if **order** = Nag_RowMajor, $\mathbf{pda} \geq \max(1, \mathbf{n})$.

7: **b**[$dim$] – Complex *Input/Output*

**Note**: the dimension, *dim*, of the array **b** must be at least

$\max(1, \mathbf{pdb} \times \mathbf{nrhs})$ when **order** = Nag_ColMajor;
$\max(1, \max(1, \mathbf{m}, \mathbf{n}) \times \mathbf{pdb})$ when **order** = Nag_RowMajor.

The $(i, j)$th element of the matrix $B$ is stored in

$\mathbf{b}[(j-1) \times \mathbf{pdb} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{b}[(i-1) \times \mathbf{pdb} + j - 1]$ when **order** = Nag_RowMajor.

*On entry*: the $m$ by $r$ right-hand side matrix $B$.

*On exit*: **b** is overwritten by the $n$ by $r$ solution matrix $X$. If $m \geq n$ and $\mathbf{rank} = n$, the residual sum of squares for the solution in the $i$th column is given by the sum of squares of the modulus of elements $n+1, \ldots, m$ in that column.

8: **pdb** – Integer *Input*

*On entry*: the stride separating row or column elements (depending on the value of **order**) in the array **b**.

*Constraints*:

if **order** = Nag_ColMajor, **pdb** $\geq \max(1, \mathbf{m}, \mathbf{n})$;
if **order** = Nag_RowMajor, **pdb** $\geq \max(1, \mathbf{nrhs})$.

9: **s**[*dim*] – double *Output*

**Note**: the dimension, *dim*, of the array **s** must be at least $\max(1, \min(\mathbf{m}, \mathbf{n}))$.

*On exit*: the singular values of $A$ in decreasing order.

10: **rcond** – double *Input*

*On entry*: used to determine the effective rank of $A$. Singular values $\mathbf{s}[i-1] \leq \mathbf{rcond} \times \mathbf{s}[0]$ are treated as zero. If **rcond** $< 0$, ***machine precision*** is used instead.

11: **rank** – Integer * *Output*

*On exit*: the effective rank of $A$, i.e., the number of singular values which are greater than **rcond** $\times$ **s**[0].

12: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

**NE_BAD_PARAM**

On entry, argument ⟨*value*⟩ had an illegal value.

**NE_CONVERGENCE**

The algorithm for computing the SVD failed to converge; ⟨*value*⟩ off-diagonal elements of an intermediate bidiagonal form did not converge to zero.

**NE_INT**

On entry, **m** = ⟨*value*⟩.
Constraint: **m** $\geq 0$.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** $\geq 0$.

On entry, **nrhs** = ⟨*value*⟩.
Constraint: **nrhs** $\geq 0$.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** $> 0$.

On entry, **pdb** = ⟨*value*⟩.
Constraint: **pdb** $> 0$.

**NE_INT_2**

On entry, **pda** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{m})$.

On entry, **pda** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

On entry, **pdb** $= \langle value \rangle$ and **nrhs** $= \langle value \rangle$.
Constraint: **pdb** $\geq \max(1, \mathbf{nrhs})$.

**NE_INT_3**

On entry, **pdb** $= \langle value \rangle$, **m** $= \langle value \rangle$ and **n** $= \langle value \rangle$.
Constraint: **pdb** $\geq \max(1, \mathbf{m}, \mathbf{n})$.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

## 7 Accuracy

See Section 4.5 of Anderson *et al.* (1999) for details.

## 8 Parallelism and Performance

nag_zgelsd (f08kqc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zgelsd (f08kqc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The real analogue of this function is nag_dgelsd (f08kcc).

## 10 Example

This example solves the linear least squares problem

$$\min_x \|b - Ax\|_2$$

for the solution, $x$, of minimum norm, where

$$A = \begin{pmatrix} 0.47 - 0.34i & -0.32 - 0.23i & 0.35 - 0.60i & 0.89 + 0.71i & -0.19 + 0.06i \\ -0.40 + 0.54i & -0.05 + 0.20i & -0.52 - 0.34i & -0.45 - 0.45i & 0.11 - 0.85i \\ 0.60 + 0.01i & -0.26 - 0.44i & 0.87 - 0.11i & -0.02 - 0.57i & 1.44 + 0.80i \\ 0.80 - 1.02i & -0.43 + 0.17i & -0.34 - 0.09i & 1.14 - 0.78i & 0.07 + 1.14i \end{pmatrix}$$

and

$$b = \begin{pmatrix} 2.15 - 0.20i \\ -2.24 + 1.82i \\ 4.45 - 4.28i \\ 5.70 - 6.25i \end{pmatrix}.$$

A tolerance of 0.01 is used to determine the effective rank of $A$.
