# NAG Library Function Document

# nag_dgees (f08pac)

## 1 Purpose

nag_dgees (f08pac) computes the eigenvalues, the real Schur form $T$, and, optionally, the matrix of Schur vectors $Z$ for an $n$ by $n$ real nonsymmetric matrix $A$.

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dgees (Nag_OrderType order, Nag_JobType jobvs,
     Nag_SortEigValsType sort,
     Nag_Boolean  (*select)(double wr, double wi),
     Integer n, double a[], Integer pda, Integer *sdim, double wr[],
     double wi[], double vs[], Integer pdvs, NagError *fail)
```

## 3 Description

The real Schur factorization of $A$ is given by

$$A = ZTZ^{\mathrm{T}},$$

where $Z$, the matrix of Schur vectors, is orthogonal and $T$ is the real Schur form. A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

$$\begin{bmatrix} a & b \\ c & a \end{bmatrix}$$

where $bc < 0$. The eigenvalues of such a block are $a \pm \sqrt{bc}$.

Optionally, nag_dgees (f08pac) also orders the eigenvalues on the diagonal of the real Schur form so that selected eigenvalues are at the top left. The leading columns of $Z$ form an orthonormal basis for the invariant subspace corresponding to the selected eigenvalues.

## 5 Arguments

1: **order** – Nag_OrderType *Input*

*On entry*: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint*: **order** = Nag_RowMajor or Nag_ColMajor.

2: **jobvs** – Nag_JobType *Input*

*On entry*: if **jobvs** = Nag_DoNothing, Schur vectors are not computed.

If **jobvs** = Nag_Schur, Schur vectors are computed.

*Constraint*: **jobvs** = Nag_DoNothing or Nag_Schur.

3: **sort** – Nag_SortEigValsType *Input*

*On entry*: specifies whether or not to order the eigenvalues on the diagonal of the Schur form.

**sort** = Nag_NoSortEigVals
Eigenvalues are not ordered.

**sort** = Nag_SortEigVals
Eigenvalues are ordered (see **select**).

*Constraint*: **sort** = Nag_NoSortEigVals or Nag_SortEigVals.

4: **select** – function, supplied by the user *External Function*

If **sort** = Nag_SortEigVals, **select** is used to select eigenvalues to sort to the top left of the Schur form.

If **sort** = Nag_NoSortEigVals, **select** is not referenced and nag_dgees (f08pac) may be specified as NULLFN.

An eigenvalue $\mathbf{wr}[j-1]+\sqrt{-1}\times\mathbf{wi}[j-1]$ is selected if $\mathbf{select}(\mathbf{wr}[j-1],\mathbf{wi}[j-1])$ is Nag_TRUE. If either one of a complex conjugate pair of eigenvalues is selected, then both are. Note that a selected complex eigenvalue may no longer satisfy $\mathbf{select}(\mathbf{wr}[j-1],\mathbf{wi}[j-1])=$ Nag_TRUE after ordering, since ordering may change the value of complex eigenvalues (especially if the eigenvalue is ill-conditioned); in this case **fail.errnum** is set to $\mathbf{n}+2$.

The specification of **select** is:

```
Nag_Boolean  select (double wr, double wi)
```

1: **wr** – double *Input*
2: **wi** – double *Input*

*On entry*: the real and imaginary parts of the eigenvalue.

5: **n** – Integer *Input*

*On entry*: $n$, the order of the matrix $A$.

*Constraint*: $\mathbf{n}\geq 0$.

6: **a**[$dim$] – double *Input/Output*

**Note**: the dimension, *dim*, of the array **a** must be at least $\max(1,\mathbf{pda}\times\mathbf{n})$.

The $(i,j)$th element of the matrix $A$ is stored in

**a**$[(j-1)\times\mathbf{pda}+i-1]$ when **order** = Nag_ColMajor;
**a**$[(i-1)\times\mathbf{pda}+j-1]$ when **order** = Nag_RowMajor.

*On entry*: the $n$ by $n$ matrix $A$.

*On exit*: **a** is overwritten by its real Schur form $T$.

7: **pda** – Integer *Input*

*On entry*: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

*Constraint*: **pda** $\geq \max(1, \mathbf{n})$.

8: **sdim** – Integer * *Output*

*On exit*: if **sort** = Nag_NoSortEigVals, **sdim** $= 0$.

If **sort** = Nag_SortEigVals, **sdim** = number of eigenvalues (after sorting) for which **select** is Nag_TRUE. (Complex conjugate pairs for which **select** is Nag_TRUE for either eigenvalue count as 2.)

9: **wr**[$dim$] – double *Output*

**Note**: the dimension, *dim*, of the array **wr** must be at least $\max(1, \mathbf{n})$.

*On exit*: see the description of **wi**.

10: **wi**[$dim$] – double *Output*

**Note**: the dimension, *dim*, of the array **wi** must be at least $\max(1, \mathbf{n})$.

*On exit*: **wr** and **wi** contain the real and imaginary parts, respectively, of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form $T$. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.

11: **vs**[$dim$] – double *Output*

**Note**: the dimension, *dim*, of the array **vs** must be at least

$\max(1, \mathbf{pdvs} \times \mathbf{n})$ when **jobvs** = Nag_Schur;
1 otherwise.

The $i$th element of the $j$th vector is stored in

**vs**$[(j-1) \times \mathbf{pdvs} + i - 1]$ when **order** = Nag_ColMajor;
**vs**$[(i-1) \times \mathbf{pdvs} + j - 1]$ when **order** = Nag_RowMajor.

*On exit*: if **jobvs** = Nag_Schur, **vs** contains the orthogonal matrix $Z$ of Schur vectors.

If **jobvs** = Nag_DoNothing, **vs** is not referenced.

12: **pdvs** – Integer *Input*

*On entry*: the stride used in the array **vs**.

*Constraints*:

if **jobvs** = Nag_Schur, **pdvs** $\geq \max(1, \mathbf{n})$;
otherwise **pdvs** $\geq 1$.

13: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

**NE_BAD_PARAM**

On entry, argument ⟨*value*⟩ had an illegal value.

**NE_CONVERGENCE**

The $QR$ algorithm failed to compute all the eigenvalues.

**NE_ENUM_INT_2**

On entry, **jobvs** = ⟨*value*⟩, **pdvs** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: if **jobvs** = Nag_Schur, **pdvs** $\geq \max(1, \mathbf{n})$;
otherwise **pdvs** $\geq 1$.

**NE_INT**

On entry, **n** = ⟨*value*⟩.
Constraint: **n** $\geq 0$.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** $> 0$.

On entry, **pdvs** = ⟨*value*⟩.
Constraint: **pdvs** $> 0$.

**NE_INT_2**

On entry, **pda** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

**NE_SCHUR_REORDER**

The eigenvalues could not be reordered because some eigenvalues were too close to separate (the problem is very ill-conditioned).

**NE_SCHUR_REORDER_SELECT**

After reordering, roundoff changed values of some complex eigenvalues so that leading eigenvalues in the Schur form no longer satisfy **select** = Nag_TRUE. This could also be caused by underflow due to scaling.

## 7 Accuracy

The computed Schur factorization satisfies

$$A + E = ZTZ^{\mathrm{T}},$$

where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and $\epsilon$ is the ***machine precision***. See Section 4.8 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

nag_dgees (f08pac) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_dgees (f08pac) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of floating-point operations is proportional to $n^3$.

The complex analogue of this function is nag_zgees (f08pnc).

## 10 Example

This example finds the Schur factorization of the matrix

$$A = \begin{pmatrix} 0.35 & 0.45 & -0.14 & -0.17 \\ 0.09 & 0.07 & -0.54 & 0.35 \\ -0.44 & -0.33 & -0.03 & 0.17 \\ 0.25 & -0.32 & -0.13 & 0.11 \end{pmatrix},$$

such that the real eigenvalues of $A$ are the top left diagonal elements of the Schur form, $T$.
