

## NAG Library Function Document

### nag\_ztrsna (f08qyc)

## 1 Purpose

nag\_ztrsna (f08qyc) estimates condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix.

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_ztrsna (Nag_OrderType order, Nag_JobType job,
                 Nag_HowManyType how_many, const Nag_Boolean select[], Integer n,
                 const Complex t[], Integer pdt, const Complex vl[], Integer pdvl,
                 const Complex vr[], Integer pdvr, double s[], double sep[], Integer mm,
                 Integer *m, NagError *fail)
```

## 3 Description

nag\_ztrsna (f08qyc) estimates condition numbers for specified eigenvalues and/or right eigenvectors of a complex upper triangular matrix  $T$ . These are the same as the condition numbers of the eigenvalues and right eigenvectors of an original matrix  $A = ZTZ^H$  (with unitary  $Z$ ), from which  $T$  may have been derived.

nag\_ztrsna (f08qyc) computes the reciprocal of the condition number of an eigenvalue  $\lambda_i$  as

$$s_i = \frac{|v^H u|}{\|u\|_E \|v\|_E},$$

where  $u$  and  $v$  are the right and left eigenvectors of  $T$ , respectively, corresponding to  $\lambda_i$ . This reciprocal condition number always lies between zero (i.e., ill-conditioned) and one (i.e., well-conditioned).

An approximate error estimate for a computed eigenvalue  $\lambda_i$  is then given by

$$\frac{\epsilon \|T\|}{s_i},$$

where  $\epsilon$  is the *machine precision*.

To estimate the reciprocal of the condition number of the right eigenvector corresponding to  $\lambda_i$ , the function first calls nag\_ztrexc (f08qtc) to reorder the eigenvalues so that  $\lambda_i$  is in the leading position:

$$T = Q \begin{pmatrix} \lambda_i & c^H \\ 0 & T_{22} \end{pmatrix} Q^H.$$

The reciprocal condition number of the eigenvector is then estimated as  $sep_i$ , the smallest singular value of the matrix  $(T_{22} - \lambda_i I)$ . This number ranges from zero (i.e., ill-conditioned) to very large (i.e., well-conditioned).

An approximate error estimate for a computed right eigenvector  $u$  corresponding to  $\lambda_i$  is then given by

$$\frac{\epsilon \|T\|}{sep_i}.$$

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **job** – Nag\_JobType *Input*

*On entry:* indicates whether condition numbers are required for eigenvalues and/or eigenvectors.

**job** = Nag\_EigVals

Condition numbers for eigenvalues only are computed.

**job** = Nag\_EigVecs

Condition numbers for eigenvectors only are computed.

**job** = Nag\_DoBoth

Condition numbers for both eigenvalues and eigenvectors are computed.

*Constraint:* **job** = Nag\_EigVals, Nag\_EigVecs or Nag\_DoBoth.

3: **how\_many** – Nag\_HowManyType *Input*

*On entry:* indicates how many condition numbers are to be computed.

**how\_many** = Nag\_ComputeAll

Condition numbers for all eigenpairs are computed.

**how\_many** = Nag\_ComputeSelected

Condition numbers for selected eigenpairs (as specified by **select**) are computed.

*Constraint:* **how\_many** = Nag\_ComputeAll or Nag\_ComputeSelected.

4: **select**[*dim*] – const Nag\_Boolean *Input*

**Note:** the dimension, *dim*, of the array **select** must be at least

**n** when **how\_many** = Nag\_ComputeSelected;  
otherwise **select** may be **NULL**.

*On entry:* specifies the eigenpairs for which condition numbers are to be computed if **how\_many** = Nag\_ComputeSelected. To select condition numbers for the eigenpair corresponding to the eigenvalue  $\lambda_j$ , **select**[*j* – 1] must be set to Nag\_TRUE.

If **how\_many** = Nag\_ComputeAll, **select** is not referenced and may be **NULL**.

5: **n** – Integer *Input*

*On entry:* *n*, the order of the matrix *T*.

*Constraint:* **n**  $\geq 0$ .

6: **t**[*dim*] – const Complex *Input*

**Note:** the dimension, *dim*, of the array **t** must be at least **pdt**  $\times$  **n**.

The (*i*, *j*)th element of the matrix *T* is stored in

**t**[ $(j - 1) \times \text{pdt} + i - 1$ ] when **order** = Nag\_ColMajor;  
**t**[ $(i - 1) \times \text{pdt} + j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* the *n* by *n* upper triangular matrix *T*, as returned by nag\_zhseqr (f08psc).

7: **pdt** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **t**.

*Constraint:*  $\text{pdt} \geq \max(1, \mathbf{n})$ .

8: **vl**[*dim*] – const Complex *Input*

**Note:** the dimension, *dim*, of the array **vl** must be at least

$\text{pdvl} \times \mathbf{mm}$  when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_ColMajor;  
 $\mathbf{n} \times \text{pdvl}$  when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_RowMajor;  
otherwise **vl** may be **NULL**.

The (*i*, *j*)th element of the matrix is stored in

$\text{vl}[(j - 1) \times \text{pdvl} + i - 1]$  when **order** = Nag\_ColMajor;  
 $\text{vl}[(i - 1) \times \text{pdvl} + j - 1]$  when **order** = Nag\_RowMajor.

*On entry:* if **job** = Nag\_EigVals or Nag\_DoBoth, **vl** must contain the left eigenvectors of  $T$  (or of any matrix  $QTQ^H$  with  $Q$  unitary) corresponding to the eigenpairs specified by **how\_many** and **select**. The eigenvectors **must** be stored in consecutive rows or columns (depending on the value of **order**) of **vl**, as returned by nag\_zhsein (f08pxc) or nag\_ztrevc (f08qxc).

If **job** = Nag\_EigVecs, **vl** is not referenced and may be **NULL**.

9: **pdvl** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **vl**.

*Constraints:*

if **order** = Nag\_ColMajor,  
    if **job** = Nag\_EigVals or Nag\_DoBoth,  $\text{pdvl} \geq \mathbf{n}$ ;  
    if **job** = Nag\_EigVecs, **vl** may be **NULL**.;  
if **order** = Nag\_RowMajor,  
    if **job** = Nag\_EigVals or Nag\_DoBoth,  $\text{pdvl} \geq \mathbf{mm}$ ;  
    if **job** = Nag\_EigVecs, **vl** may be **NULL**..

10: **vr**[*dim*] – const Complex *Input*

**Note:** the dimension, *dim*, of the array **vr** must be at least

$\text{pdvr} \times \mathbf{mm}$  when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_ColMajor;  
 $\mathbf{n} \times \text{pdvr}$  when **job** = Nag\_EigVals or Nag\_DoBoth and **order** = Nag\_RowMajor;  
otherwise **vr** may be **NULL**.

The (*i*, *j*)th element of the matrix is stored in

$\text{vr}[(j - 1) \times \text{pdvr} + i - 1]$  when **order** = Nag\_ColMajor;  
 $\text{vr}[(i - 1) \times \text{pdvr} + j - 1]$  when **order** = Nag\_RowMajor.

*On entry:* if **job** = Nag\_EigVals or Nag\_DoBoth, **vr** must contain the right eigenvectors of  $T$  (or of any matrix  $QTQ^H$  with  $Q$  unitary) corresponding to the eigenpairs specified by **how\_many** and **select**. The eigenvectors **must** be stored in consecutive rows or columns (depending on the value of **order**) of **vr**, as returned by nag\_zhsein (f08pxc) or nag\_ztrevc (f08qxc).

If **job** = Nag\_EigVecs, **vr** is not referenced and may be **NULL**.

11: **pdvr** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **vr**.

*Constraints:*

```

if order = Nag_ColMajor,
    if job = Nag_EigVals or Nag_DoBoth, pdvr  $\geq n$ ;
    if job = Nag_EigVecs, vr may be NULL.;
if order = Nag_RowMajor,
    if job = Nag_EigVals or Nag_DoBoth, pdvr  $\geq mm$ ;
    if job = Nag_EigVecs, vr may be NULL.;
```

12: **s**[*dim*] – double *Output*

**Note:** the dimension, *dim*, of the array **s** must be at least

**mm** when **job** = Nag\_EigVals or Nag\_DoBoth;  
otherwise **s** may be **NULL**.

*On exit:* the reciprocal condition numbers of the selected eigenvalues if **job** = Nag\_EigVals or Nag\_DoBoth, stored in consecutive elements of the array. Thus **s**[*j* – 1], **sep**[*j* – 1] and the *j*th rows or columns of **vl** and **vr** all correspond to the same eigenpair (but not in general the *j*th eigenpair unless all eigenpairs have been selected).

If **job** = Nag\_EigVecs, **s** is not referenced and may be **NULL**.

13: **sep**[*dim*] – double *Output*

**Note:** the dimension, *dim*, of the array **sep** must be at least

**mm** when **job** = Nag\_EigVecs or Nag\_DoBoth;  
otherwise **sep** may be **NULL**.

*On exit:* the estimated reciprocal condition numbers of the selected right eigenvectors if **job** = Nag\_EigVecs or Nag\_DoBoth, stored in consecutive elements of the array.

If **job** = Nag\_EigVals, **sep** is not referenced and may be **NULL**.

14: **mm** – Integer *Input*

*On entry:* the number of elements in the arrays **s** and **sep**, and the number of rows or columns (depending on the value of **order**) in the arrays **vl** and **vr** (if used). The precise number required,  $required_{rowcol}$ , is *n* if **how\_many** = Nag\_ComputeAll; if **how\_many** = Nag\_ComputeSelected,  $required_{rowcol}$  is the number of selected eigenpairs (see **select**), in which case  $0 \leq required_{rowcol} \leq n$ .

*Constraints:*

if **how\_many** = Nag\_ComputeAll, **mm**  $\geq n$ ;  
otherwise **mm**  $\geq required_{rowcol}$ .

15: **m** – Integer \* *Output*

*On exit:*  $required_{rowcol}$ , the number of selected eigenpairs. If **how\_many** = Nag\_ComputeAll, **m** is set to *n*.

16: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

**NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

**NE\_ENUM\_INT\_2**

On entry,  $\mathbf{job} = \langle value \rangle$ ,  $\mathbf{pdvl} = \langle value \rangle$ ,  $\mathbf{mm} = \langle value \rangle$ .

Constraint: if  $\mathbf{job} = \text{Nag\_EigVals}$  or  $\text{Nag\_DoBoth}$ ,  $\mathbf{pdvl} \geq \mathbf{mm}$ .

On entry,  $\mathbf{job} = \langle value \rangle$ ,  $\mathbf{pdvl} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ .

Constraint: if  $\mathbf{job} = \text{Nag\_EigVals}$  or  $\text{Nag\_DoBoth}$ ,  $\mathbf{pdvl} \geq \mathbf{n}$ .

On entry,  $\mathbf{job} = \langle value \rangle$ ,  $\mathbf{pdvr} = \langle value \rangle$ ,  $\mathbf{mm} = \langle value \rangle$ .

Constraint: if  $\mathbf{job} = \text{Nag\_EigVals}$  or  $\text{Nag\_DoBoth}$ ,  $\mathbf{pdvr} \geq \mathbf{mm}$ .

On entry,  $\mathbf{job} = \langle value \rangle$ ,  $\mathbf{pdvr} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ .

Constraint: if  $\mathbf{job} = \text{Nag\_EigVals}$  or  $\text{Nag\_DoBoth}$ ,  $\mathbf{pdvr} \geq \mathbf{n}$ .

On entry,  $\mathbf{mm} = \langle value \rangle$ ,  $\mathbf{n} = \langle value \rangle$  and  $\mathbf{how\_many} = \langle value \rangle$ .

Constraint: if  $\mathbf{how\_many} = \text{Nag\_ComputeAll}$ ,  $\mathbf{mm} \geq \mathbf{n}$ ;

otherwise  $\mathbf{mm} \geq \text{required}_{rowcol}$ .

**NE\_INT**

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

On entry,  $\mathbf{pdt} = \langle value \rangle$ .

Constraint:  $\mathbf{pdt} > 0$ .

On entry,  $\mathbf{pdvl} = \langle value \rangle$ .

Constraint:  $\mathbf{pdvl} > 0$ .

On entry,  $\mathbf{pdvr} = \langle value \rangle$ .

Constraint:  $\mathbf{pdvr} > 0$ .

**NE\_INT\_2**

On entry,  $\mathbf{pdt} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{pdt} \geq \max(1, \mathbf{n})$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

**7 Accuracy**

The computed values  $sep_i$  may over estimate the true value, but seldom by a factor of more than 3.

**8 Parallelism and Performance**

`nag_ztrsna` (f08qyc) is not threaded by NAG in any implementation.

`nag_ztrsna` (f08qyc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

The real analogue of this function is `nag_dtrsna` (f08qlc).

## 10 Example

This example computes approximate error estimates for all the eigenvalues and right eigenvectors of the matrix  $T$ , where

$$T = \begin{pmatrix} -6.0004 - 6.9999i & 0.3637 - 0.3656i & -0.1880 + 0.4787i & 0.8785 - 0.2539i \\ 0.0000 + 0.0000i & -5.0000 + 2.0060i & -0.0307 - 0.7217i & -0.2290 + 0.1313i \\ 0.0000 + 0.0000i & 0.0000 + 0.0000i & 7.9982 - 0.9964i & 0.9357 + 0.5359i \\ 0.0000 + 0.0000i & 0.0000 + 0.0000i & 0.0000 + 0.0000i & 3.0023 - 3.9998i \end{pmatrix}.$$
