NAG Library Function Document

nag_zspmv (f16tcc)

1 Purpose

nag_zspmv (f16tcc) performs matrix-vector multiplication for a complex symmetric matrix stored in packed form.

2 Specification

```
#include <nag.h>
#include <nagf16.h>
```

```
void nag_zspmv (Nag_OrderType order, Nag_UploType uplo, Integer n,
     Complex alpha, const Complex ap[], const Complex x[], Integer incx,
     Complex beta, Complex y[], Integer incy, NagError *fail)
```

3 Description

nag_zspmv (f16tcc) performs the matrix-vector operation

$$y \leftarrow \alpha Ax + \beta y$$

where A is an n by n complex symmetric matrix stored in packed form, x and y are n-element complex vectors, and α and β are complex scalars.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UploType *Input*

On entry: specifies whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper
The upper triangular part of A is stored.

uplo = Nag_Lower
The lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3: **n** – Integer *Input*

On entry: n, the order of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

4: **alpha** – Complex *Input*

On entry: the scalar α.

5: **ap**[dim] – const Complex *Input*

Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$.

On entry: the n by n symmetric matrix A, packed by rows or columns.

The storage of elements A_{ij} depends on the **order** and **uplo** arguments as follows:

if **order** = 'Nag_ColMajor' and **uplo** = 'Nag_Upper',
A_{ij} is stored in **ap**$[(j-1) \times j/2 + i - 1]$, for $i \leq j$;
if **order** = 'Nag_ColMajor' and **uplo** = 'Nag_Lower',
A_{ij} is stored in **ap**$[(2n-j) \times (j-1)/2 + i - 1]$, for $i \geq j$;
if **order** = 'Nag_RowMajor' and **uplo** = 'Nag_Upper',
A_{ij} is stored in **ap**$[(2n-i) \times (i-1)/2 + j - 1]$, for $i \leq j$;
if **order** = 'Nag_RowMajor' and **uplo** = 'Nag_Lower',
A_{ij} is stored in **ap**$[(i-1) \times i/2 + j - 1]$, for $i \geq j$.

6: **x**[dim] – const Complex *Input*

Note: the dimension, *dim*, of the array **x** must be at least $\max(1, 1 + (\mathbf{n} - 1)|\mathbf{incx}|)$.

On entry: the vector x.

7: **incx** – Integer *Input*

On entry: the increment in the subscripts of **x** between successive elements of x.

Constraint: **incx** $\neq 0$.

8: **beta** – Complex *Input*

On entry: the scalar β.

9: **y**[dim] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **y** must be at least $\max(1, 1 + (\mathbf{n} - 1)|\mathbf{incy}|)$.

On entry: the vector y.

If **beta** $= 0$, **y** need not be set.

On exit: the updated vector y.

10: **incy** – Integer *Input*

On entry: the increment in the subscripts of **y** between successive elements of y.

Constraint: **incy** $\neq 0$.

11: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **incx** = ⟨*value*⟩.
Constraint: **incx** $\neq 0$.

On entry, **incy** $= \langle value \rangle$.
Constraint: **incy** $\neq 0$.

On entry, **n** $= \langle value \rangle$.
Constraint: **n** ≥ 0.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

This example computes the matrix-vector product

$$y = \alpha Ax + \beta y$$

where

$$A = \begin{pmatrix} 1.0+1.0i & 2.0+1.0i & 3.0+1.0i & 4.0+1.0i \\ 2.0+1.0i & 2.0+2.0i & 3.0+2.0i & 4.0+2.0i \\ 3.0+1.0i & 3.0+2.0i & 3.0+3.0i & 4.0+3.0i \\ 4.0+1.0i & 4.0+2.0i & 4.0+3.0i & 4.0+4.0i \end{pmatrix},$$

$$x = \begin{pmatrix} 1.0+0.0i \\ 0.0-1.0i \\ -1.0+0.0i \\ 0.0+1.0i \end{pmatrix},$$

$$y = \begin{pmatrix} 10.0+\ \ 4.0i \\ 10.0+\ \ 8.0i \\ 10.0+16.0i \\ 14.0+24.0i \end{pmatrix},$$

$$\alpha = 1.0+1.0i \quad \text{and} \quad \beta = 0.5+0.0i.$$
