NAG Library Function Document

nag_rand_matrix_multi_students_t (g05ryc)

1 Purpose

nag_rand_matrix_multi_students_t (g05ryc) sets up a reference vector and generates an array of pseudorandom numbers from a multivariate Student's t distribution with ν degrees of freedom, mean vector a and covariance matrix $\frac{\nu}{\nu-2}C$.

2 Specification

```
#include <nag.h>
#include <nagg05.h>
void nag_rand_matrix_multi_students_t (Nag_OrderType order,
     Nag_ModeRNG mode, Integer n, Integer df, Integer m, const double xmu[],
     const double c[], Integer pdc, double r[], Integer lr, Integer state[],
     double x[], Integer pdx, NagError *fail)
```

3 Description

When the covariance matrix is nonsingular (i.e., strictly positive definite), the distribution has probability density function

$$f(x) = \frac{\Gamma\left(\frac{(\nu+m)}{2}\right)}{(\pi v)^{m/2}\Gamma(\nu/2)|C|^{\frac{1}{2}}}\left[1+\frac{(x-a)^{\mathrm{T}}C^{-1}(x-a)}{\nu}\right]^{\frac{-(\nu+m)}{2}}$$

where m is the number of dimensions, ν is the degrees of freedom, a is the vector of means, x is the vector of positions and $\frac{\nu}{\nu-2}C$ is the covariance matrix.

The function returns the value

$$x = a + \sqrt{\frac{\nu}{s}}z$$

where z is generated by nag_rand_normal (g05skc) from a Normal distribution with mean zero and covariance matrix C and s is generated by nag_rand_chi_sq (g05sdc) from a χ^2-distribution with ν degrees of freedom.

One of the initialization functions nag_rand_init_repeatable (g05kfc) (for a repeatable sequence if computed sequentially) or nag_rand_init_nonrepeatable (g05kgc) (for a non-repeatable sequence) must be called prior to the first call to nag_rand_matrix_multi_students_t (g05ryc).

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by

order = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **mode** – Nag_ModeRNG *Input*

On entry: a code for selecting the operation to be performed by the function.

mode = Nag_InitializeReference
Set up reference vector only.

mode = Nag_GenerateFromReference
Generate variates using reference vector set up in a prior call to nag_rand_matrix_multi_students_t (g05ryc).

mode = Nag_InitializeAndGenerate
Set up reference vector and generate variates.

Constraint: **mode** = Nag_InitializeReference, Nag_GenerateFromReference or Nag_InitializeAndGenerate.

3: **n** – Integer *Input*

On entry: n, the number of random variates required.

Constraint: **n** ≥ 0.

4: **df** – Integer *Input*

On entry: ν, the number of degrees of freedom of the distribution.

Constraint: **df** ≥ 3.

5: **m** – Integer *Input*

On entry: m, the number of dimensions of the distribution.

Constraint: **m** > 0.

6: **xmu**[**m**] – const double *Input*

On entry: a, the vector of means of the distribution.

7: **c**[dim] – const double *Input*

Note: the dimension, *dim*, of the array **c** must be at least **pdc** $\times$ **m**.

The (i,j)th element of the matrix C is stored in

c$[(j-1) \times$ **pdc** $+ i - 1]$ when **order** = Nag_ColMajor;
c$[(i-1) \times$ **pdc** $+ j - 1]$ when **order** = Nag_RowMajor.

On entry: matrix which, along with **df**, defines the covariance of the distribution. Only the upper triangle need be set.

Constraint: **c** must be positive semidefinite to ***machine precision***.

8: **pdc** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **c**.

Constraint: **pdc** $\geq$ **m**.

9: **r**[**lr**] – double *Input/Output*

On entry: if **mode** = Nag_GenerateFromReference, the reference vector as set up by nag_rand_matrix_multi_students_t (g05ryc) in a previous call with **mode** = Nag_InitializeReference or Nag_InitializeAndGenerate.

On exit: if **mode** = Nag_InitializeReference or Nag_InitializeAndGenerate, the reference vector that can be used in subsequent calls to nag_rand_matrix_multi_students_t (g05ryc) with **mode** = Nag_GenerateFromReference.

10: **lr** – Integer *Input*

On entry: the dimension of the array **r**. If **mode** = Nag_GenerateFromReference, it must be the same as the value of **lr** specified in the prior call to nag_rand_matrix_multi_students_t (g05ryc) with **mode** = Nag_InitializeReference or Nag_InitializeAndGenerate.

Constraint: $\mathbf{lr} \geq \mathbf{m} \times (\mathbf{m} + 1) + 2$.

11: **state**[dim] – Integer *Communication Array*

Note: the dimension, dim, of this array is dictated by the requirements of associated functions that must have been previously called. This array MUST be the same array passed as argument **state** in the previous call to nag_rand_init_repeatable (g05kfc) or nag_rand_init_nonrepeatable (g05kgc).

On entry: contains information on the selected base generator and its current state.

On exit: contains updated information on the state of the generator.

12: **x**[dim] – double *Output*

Note: the dimension, *dim*, of the array **x** must be at least

$\max(1, \mathbf{pdx} \times \mathbf{m})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{n} \times \mathbf{pdx})$ when **order** = Nag_RowMajor.

Where $\mathbf{X}(i, j)$ appears in this document, it refers to the array element

$\mathbf{x}[(j-1) \times \mathbf{pdx} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{x}[(i-1) \times \mathbf{pdx} + j - 1]$ when **order** = Nag_RowMajor.

On exit: the array of pseudorandom multivariate Student's t vectors generated by the function, with $\mathbf{X}(i, j)$ holding the jth dimension for the ith variate.

13: **pdx** – Integer *Input*

On entry: the stride used in the array **x**.

Constraints:

if **order** = Nag_ColMajor, $\mathbf{pdx} \geq \mathbf{n}$;
if **order** = Nag_RowMajor, $\mathbf{pdx} \geq \mathbf{m}$.

14: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **df** = ⟨*value*⟩.
Constraint: $\mathbf{df} \geq 3$.

On entry, **lr** is not large enough, **lr** = ⟨*value*⟩: minimum length required = ⟨*value*⟩.

On entry, **m** = ⟨*value*⟩.
Constraint: **m** > 0.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

NE_INT_2

On entry, **pdc** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: **pdc** ≥ **m**.

On entry, **pdx** = ⟨*value*⟩ and **m** = ⟨*value*⟩.
Constraint: **pdx** ≥ **m**.

On entry, **pdx** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **pdx** ≥ **n**.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_INVALID_STATE

On entry, **state** vector has been corrupted or not initialized.

NE_POS_DEF

On entry, the covariance matrix C is not positive semidefinite to ***machine precision***.

NE_PREV_CALL

m is not the same as when **r** was set up in a previous call.
Previous value of **m** = ⟨*value*⟩ and **m** = ⟨*value*⟩.

7 Accuracy

Not applicable.

8 Parallelism and Performance

nag_rand_matrix_multi_students_t (g05ryc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_rand_matrix_multi_students_t (g05ryc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken by nag_rand_matrix_multi_students_t (g05ryc) is of order nm^3.

It is recommended that the diagonal elements of C should not differ too widely in order of magnitude. This may be achieved by scaling the variables if necessary. The actual matrix decomposed is $C + E = LL^{\mathrm{T}}$, where E is a diagonal matrix with small positive diagonal elements. This ensures that, even when C is singular, or nearly singular, the Cholesky factor L corresponds to a positive definite covariance matrix that agrees with C within ***machine precision***.

10 Example

This example prints ten pseudorandom observations from a multivariate Student's t-distribution with ten degrees of freedom, means vector

$$\begin{bmatrix} 1.0 \\ 2.0 \\ -3.0 \\ 0.0 \end{bmatrix}$$

and **c** matrix

$$\begin{bmatrix} 1.69 & 0.39 & -1.86 & 0.07 \\ 0.39 & 98.01 & -7.07 & -0.71 \\ -1.86 & -7.07 & 11.56 & 0.03 \\ 0.07 & -0.71 & 0.03 & 0.01 \end{bmatrix},$$

generated by nag_rand_matrix_multi_students_t (g05ryc). All ten observations are generated by a single call to nag_rand_matrix_multi_students_t (g05ryc) with **mode** = Nag_InitializeAndGenerate. The random number generator is initialized by nag_rand_init_repeatable (g05kfc).
