

NAG Library Routine Document

F07CUF (ZGTCON)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F07CUF (ZGTCON) estimates the reciprocal condition number of a complex n by n tridiagonal matrix A , using the LU factorization returned by F07CRF (ZGTTRF).

2 Specification

```
SUBROUTINE F07CUF (NORM, N, DL, D, DU, DU2, IPIV, ANORM, RCOND, WORK, INFO)
INTEGER N, IPIV(*), INFO
REAL (KIND=nag_wp) ANORM, RCOND
COMPLEX (KIND=nag_wp) DL(*), D(*), DU(*), DU2(*), WORK(2*N)
CHARACTER(1) NORM
```

The routine may be called by its LAPACK name *zgtcon*.

3 Description

F07CUF (ZGTCON) should be preceded by a call to F07CRF (ZGTTRF), which uses Gaussian elimination with partial pivoting and row interchanges to factorize the matrix A as

$$A = PLU,$$

where P is a permutation matrix, L is unit lower triangular with at most one nonzero subdiagonal element in each column, and U is an upper triangular band matrix, with two superdiagonals. F07CUF (ZGTCON) then utilizes the factorization to estimate either $\|A^{-1}\|_1$ or $\|A^{-1}\|_\infty$, from which the estimate of the reciprocal of the condition number of A , $1/\kappa(A)$ is computed as either

$$1/\kappa_1(A) = 1/\left(\|A\|_1 \|A^{-1}\|_1\right)$$

or

$$1/\kappa_\infty(A) = 1/\left(\|A\|_\infty \|A^{-1}\|_\infty\right).$$

$1/\kappa(A)$ is returned, rather than $\kappa(A)$, since when A is singular $\kappa(A)$ is infinite.

Note that $\kappa_\infty(A) = \kappa_1(A^T)$.

5 Parameters

- | | |
|---|--------------|
| 1: NORM – CHARACTER(1) | <i>Input</i> |
| On entry: specifies the norm to be used to estimate $\kappa(A)$. | |
| NORM = '1' or 'O' | |
| Estimate $\kappa_1(A)$. | |

NORM = 'I'

Estimate $\kappa_\infty(A)$.

Constraint: NORM = '1', 'O' or 'I'.

2: N – INTEGER

Input

On entry: n, the order of the matrix A.

Constraint: N ≥ 0 .

3: DL(*) – COMPLEX (KIND=nag_wp) array

Input

Note: the dimension of the array DL must be at least max(1, N – 1).

On entry: must contain the $(n - 1)$ multipliers that define the matrix L of the LU factorization of A.

4: D(*) – COMPLEX (KIND=nag_wp) array

Input

Note: the dimension of the array D must be at least max(1, N).

On entry: must contain the n diagonal elements of the upper triangular matrix U from the LU factorization of A.

5: DU(*) – COMPLEX (KIND=nag_wp) array

Input

Note: the dimension of the array DU must be at least max(1, N – 1).

On entry: must contain the $(n - 1)$ elements of the first superdiagonal of U.

6: DU2(*) – COMPLEX (KIND=nag_wp) array

Input

Note: the dimension of the array DU2 must be at least max(1, N – 2).

On entry: must contain the $(n - 2)$ elements of the second superdiagonal of U.

7: IPIV(*) – INTEGER array

Input

Note: the dimension of the array IPIV must be at least max(1, N).

On entry: must contain the n pivot indices that define the permutation matrix P. At the i th step, row i of the matrix was interchanged with row IPIV(i), and IPIV(i) must always be either i or $(i + 1)$, IPIV(i) = i indicating that a row interchange was not performed.

8: ANORM – REAL (KIND=nag_wp)

Input

On entry: if NORM = '1' or 'O', the 1-norm of the **original** matrix A.

If NORM = 'I', the ∞ -norm of the **original** matrix A.

ANORM may be computed by calling F06UNF with the same value for the parameter NORM.

ANORM must be computed either **before** calling F07CRF (ZGTTRF) or else from a **copy** of the original matrix A (see Section 9).

Constraint: ANORM ≥ 0.0 .

9: RCOND – REAL (KIND=nag_wp)

Output

On exit: contains an estimate of the reciprocal condition number.

10: WORK($2 \times N$) – COMPLEX (KIND=nag_wp) array

Workspace

11: INFO – INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

$\text{INFO} < 0$

If $\text{INFO} = -i$, the i th argument had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

In practice the condition number estimator is very reliable, but it can underestimate the true condition number; see Section 15.3 of Higham (2002) for further details.

8 Further Comments

The condition number estimation typically requires between four and five solves and never more than eleven solves, following the factorization. The total number of floating point operations required to perform a solve is proportional to n .

The real analogue of this routine is F07CGF (DGTCON).

9 Example

This example estimates the condition number in the 1-norm of the tridiagonal matrix A given by

$$A = \begin{pmatrix} -1.3 + 1.3i & 2.0 - 1.0i & 0 & 0 & 0 \\ 1.0 - 2.0i & -1.3 + 1.3i & 2.0 + 1.0i & 0 & 0 \\ 0 & 1.0 + 1.0i & -1.3 + 3.3i & -1.0 + 1.0i & 0 \\ 0 & 0 & 2.0 - 3.0i & -0.3 + 4.3i & 1.0 - 1.0i \\ 0 & 0 & 0 & 1.0 + 1.0i & -3.3 + 1.3i \end{pmatrix}.$$
