

# NAG Library Routine Document

## F07FFF (DPOEQU)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

F07FFF (DPOEQU) computes a diagonal scaling matrix  $S$  intended to equilibrate a real  $n$  by  $n$  symmetric positive definite matrix  $A$  and reduce its condition number.

### 2 Specification

```
SUBROUTINE F07FFF (N, A, LDA, S, SCOND, AMAX, INFO)
INTEGER N, LDA, INFO
REAL (KIND=nag_wp) A(LDA,*), S(N), SCOND, AMAX
```

The routine may be called by its LAPACK name *dpoequ*.

### 3 Description

F07FFF (DPOEQU) computes a diagonal scaling matrix  $S$  chosen so that

$$s_j = 1/\sqrt{a_{jj}}.$$

This means that the matrix  $B$  given by

$$B = SAS,$$

has diagonal elements equal to unity. This in turn means that the condition number of  $B$ ,  $\kappa_2(B)$ , is within a factor  $n$  of the matrix of smallest possible condition number over all possible choices of diagonal scalings (see Corollary 7.6 of Higham (2002)).

### 4 References

Higham N J (2002) *Accuracy and Stability of Numerical Algorithms* (2nd Edition) SIAM, Philadelphia

### 5 Parameters

- |   |              |
|---|--------------|
| 1: $N$ – INTEGER  | <i>Input</i> |
| <p><i>On entry:</i> <math>n</math>, the order of the matrix <math>A</math>.</p> <p><i>Constraint:</i> <math>N \geq 0</math>.</p>  |              |
| 2: $A(LDA,*)$ – REAL (KIND=nag_wp) array  | <i>Input</i> |
| <p><b>Note:</b> the second dimension of the array <math>A</math> must be at least <math>\max(1, N)</math>.</p> <p><i>On entry:</i> the matrix <math>A</math> whose scaling factors are to be computed. Only the diagonal elements of the array <math>A</math> are referenced.</p> |              |
| 3: $LDA$ – INTEGER  | <i>Input</i> |
| <p><i>On entry:</i> the first dimension of the array <math>A</math> as declared in the (sub)program from which F07FFF (DPOEQU) is called.</p> <p><i>Constraint:</i> <math>LDA \geq \max(1, N)</math>.</p>   |              |

4:	$S(N)$ – REAL (KIND=nag_wp) array	<i>Output</i>
<i>On exit:</i> if INFO = 0, $S$ contains the diagonal elements of the scaling matrix $S$ .		
5:	$SCOND$ – REAL (KIND=nag_wp)	<i>Output</i>
<i>On exit:</i> if INFO = 0, $SCOND$ contains the ratio of the smallest value of $S$ to the largest value of $S$ . If $SCOND \geq 0.1$ and $AMAX$ is neither too large nor too small, it is not worth scaling by $S$ .		
6:	$AMAX$ – REAL (KIND=nag_wp)	<i>Output</i>
<i>On exit:</i> $\max  a_{ij} $ . If $AMAX$ is very close to overflow or underflow, the matrix $A$ should be scaled.		
7:	$INFO$ – INTEGER	<i>Output</i>
<i>On exit:</i> $INFO = 0$ unless the routine detects an error (see Section 6).		

## 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

$INFO < 0$

If  $INFO = -i$ , the  $i$ th argument had an illegal value. An explanatory message is output, and execution of the program is terminated.

$INFO > 0$

If  $INFO = i$ , the  $i$ th diagonal element of  $A$  is not positive (and hence  $A$  cannot be positive definite).

## 7 Accuracy

The computed scale factors will be close to the exact scale factors.

## 8 Further Comments

The complex analogue of this routine is F07FTF (ZPOEQU).

## 9 Example

This example equilibrates the symmetric positive definite matrix  $A$  given by

$$A = \begin{pmatrix} 4.16 & -3.12 \times 10^5 & 0.56 & -0.10 \\ -3.12 \times 10^5 & 5.03 \times 10^{10} & -0.83 \times 10^5 & 1.18 \times 10^5 \\ 0.56 & -0.83 \times 10^5 & 0.76 & 0.34 \\ -0.10 & 1.18 \times 10^5 & 0.34 & 1.18 \end{pmatrix}.$$

Details of the scaling factors and the scaled matrix are output.
