

NAG Library Routine Document

F07GTF (ZPPEQU)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F07GTF (ZPPEQU) computes a diagonal scaling matrix S intended to equilibrate a complex n by n Hermitian positive definite matrix A , stored in packed format, and reduce its condition number.

2 Specification

SUBROUTINE F07GTF (UPLO, N, AP, S, SCOND, AMAX, INFO)

INTEGER N, INFO
 REAL (KIND=nag_wp) S(N), SCOND, AMAX
 COMPLEX (KIND=nag_wp) AP(*)
 CHARACTER(1) UPLO

The routine may be called by its LAPACK name *zppequ*.

3 Description

F07GTF (ZPPEQU) computes a diagonal scaling matrix S chosen so that

$$s_j = 1/\sqrt{a_{jj}}.$$

This means that the matrix B given by

$$B = SAS,$$

has diagonal elements equal to unity. This in turn means that the condition number of B , $\kappa_2(B)$, is within a factor n of the matrix of smallest possible condition number over all possible choices of diagonal scalings (see Corollary 7.6 of Higham (2002)).

4 References

Higham N J (2002) *Accuracy and Stability of Numerical Algorithms* (2nd Edition) SIAM, Philadelphia

5 Parameters

1: UPLO – CHARACTER(1) *Input*

On entry: indicates whether the upper or lower triangular part of A is stored in the array AP, as follows:

UPLO = 'U'

The upper triangle of A is stored.

UPLO = 'L'

The lower triangle of A is stored.

Constraint: UPLO = 'U' or 'L'.

2: N – INTEGER *Input*

On entry: n , the order of the matrix A .

Constraint: $N \geq 0$.

- 3: AP(*) – COMPLEX (KIND=nag_wp) array Input
Note: the dimension of the array AP must be at least $\max(1, N \times (N + 1)/2)$.
On entry: the n by n Hermitian matrix A , packed by columns.
 More precisely,
 if UPLO = 'U', the upper triangle of A must be stored with element A_{ij} in
 AP($i + j(j - 1)/2$) for $i \leq j$;
 if UPLO = 'L', the lower triangle of A must be stored with element A_{ij} in
 AP($i + (2n - j)(j - 1)/2$) for $i \geq j$.
 Only the elements of AP corresponding to the diagonal elements A are referenced.
- 4: S(N) – REAL (KIND=nag_wp) array Output
On exit: if INFO = 0, S contains the diagonal elements of the scaling matrix S .
- 5: SCOND – REAL (KIND=nag_wp) Output
On exit: if INFO = 0, SCOND contains the ratio of the smallest value of S to the largest value of S. If SCOND ≥ 0.1 and AMAX is neither too large nor too small, it is not worth scaling by S.
- 6: AMAX – REAL (KIND=nag_wp) Output
On exit: $\max |a_{ij}|$. If AMAX is very close to overflow or underflow, the matrix A should be scaled.
- 7: INFO – INTEGER Output
On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = $-i$, the i th argument had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

If INFO = i , the i th diagonal element of A is not positive (and hence A cannot be positive definite).

7 Accuracy

The computed scale factors will be close to the exact scale factors.

8 Further Comments

The real analogue of this routine is F07GFF (DPPEQU).

9 Example

This example equilibrates the Hermitian positive definite matrix A given by

$$A = \begin{pmatrix} 3.23 & 1.51 - 1.92i & (1.90 + 0.84i) \times 10^5 & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 & (-0.23 + 1.11i) \times 10^5 & -1.18 + 1.37i \\ (1.90 - 0.84i) \times 10^5 & (-0.23 - 1.11i) \times 10^5 & 4.09 \times 10^{10} & (2.33 - 0.14i) \times 10^5 \\ 0.42 - 2.50i & -1.18 - 1.37i & (2.33 + 0.14i) \times 10^5 & 4.29 \end{pmatrix}.$$

Details of the scaling factors and the scaled matrix are output.
