

# NAG Library Routine Document

## F07HGF (DPBCON)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

F07HGF (DPBCON) estimates the condition number of a real symmetric positive definite band matrix  $A$ , where  $A$  has been factorized by F07HDF (DPBTRF).

### 2 Specification

```
SUBROUTINE F07HGF (UPLO, N, KD, AB, LDAB, ANORM, RCOND, WORK, IWORK, INFO)
INTEGER          N, KD, LDAB, IWORK(N), INFO
REAL (KIND=nag_wp) AB(LDAB,*), ANORM, RCOND, WORK(3*N)
CHARACTER(1)    UPLO
```

The routine may be called by its LAPACK name *dpbcon*.

### 3 Description

F07HGF (DPBCON) estimates the condition number (in the 1-norm) of a real symmetric positive definite band matrix  $A$ :

$$\kappa_1(A) = \|A\|_1 \|A^{-1}\|_1.$$

Since  $A$  is symmetric,  $\kappa_1(A) = \kappa_\infty(A) = \|A\|_\infty \|A^{-1}\|_\infty$ .

Because  $\kappa_1(A)$  is infinite if  $A$  is singular, the routine actually returns an estimate of the **reciprocal** of  $\kappa_1(A)$ .

The routine should be preceded by a call to F06REF to compute  $\|A\|_1$  and a call to F07HDF (DPBTRF) to compute the Cholesky factorization of  $A$ . The routine then uses Higham's implementation of Hager's method (see Higham (1988)) to estimate  $\|A^{-1}\|_1$ .

### 4 References

Higham N J (1988) FORTRAN codes for estimating the one-norm of a real or complex matrix, with applications to condition estimation *ACM Trans. Math. Software* **14** 381–396

### 5 Parameters

1: UPLO – CHARACTER(1) *Input*  
*On entry:* specifies how  $A$  has been factorized.  
 UPLO = 'U'  
 $A = U^T U$ , where  $U$  is upper triangular.  
 UPLO = 'L'  
 $A = L L^T$ , where  $L$  is lower triangular.  
*Constraint:* UPLO = 'U' or 'L'.

- 2: N – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $N \geq 0$ .
- 3: KD – INTEGER *Input*  
*On entry:*  $k_d$ , the number of superdiagonals or subdiagonals of the matrix  $A$ .  
*Constraint:*  $KD \geq 0$ .
- 4: AB(LDAB,\*) – REAL (KIND=nag\_wp) array *Input*  
**Note:** the second dimension of the array AB must be at least  $\max(1, N)$ .  
*On entry:* the Cholesky factor of  $A$ , as returned by F07HDF (DPBTRF).
- 5: LDAB – INTEGER *Input*  
*On entry:* the first dimension of the array AB as declared in the (sub)program from which F07HGF (DPBTRF) is called.  
*Constraint:*  $LDAB \geq KD + 1$ .
- 6: ANORM – REAL (KIND=nag\_wp) *Input*  
*On entry:* the 1-norm of the **original** matrix  $A$ , which may be computed by calling F06REF with its parameter  $NORM = '1'$ . ANORM must be computed either **before** calling F07HDF (DPBTRF) or else from a **copy** of the original matrix  $A$ .  
*Constraint:*  $ANORM \geq 0.0$ .
- 7: RCOND – REAL (KIND=nag\_wp) *Output*  
*On exit:* an estimate of the reciprocal of the condition number of  $A$ . RCOND is set to zero if exact singularity is detected or the estimate underflows. If RCOND is less than *machine precision*,  $A$  is singular to working precision.
- 8: WORK(3 × N) – REAL (KIND=nag\_wp) array *Workspace*
- 9: IWORK(N) – INTEGER array *Workspace*
- 10: INFO – INTEGER *Output*  
*On exit:*  $INFO = 0$  unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If  $INFO = -i$ , the  $i$ th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

## 7 Accuracy

The computed estimate RCOND is never less than the true value  $\rho$ , and in practice is nearly always less than  $10\rho$ , although examples can be constructed where RCOND is much larger.

## 8 Further Comments

A call to F07HGF (DPBCON) involves solving a number of systems of linear equations of the form  $Ax = b$ ; the number is usually 4 or 5 and never more than 11. Each solution involves approximately  $4nk$  floating point operations (assuming  $n \gg k$ ) but takes considerably longer than a call to F07HEF (DPBTRS) with one right-hand side, because extra care is taken to avoid overflow when  $A$  is approximately singular.

The complex analogue of this routine is F07HUF (ZPBCON).

## 9 Example

This example estimates the condition number in the 1-norm (or  $\infty$ -norm) of the matrix  $A$ , where

$$A = \begin{pmatrix} 5.49 & 2.68 & 0.00 & 0.00 \\ 2.68 & 5.63 & -2.39 & 0.00 \\ 0.00 & -2.39 & 2.60 & -2.22 \\ 0.00 & 0.00 & -2.22 & 5.17 \end{pmatrix}.$$

Here  $A$  is symmetric and positive definite, and is treated as a band matrix, which must first be factorized by F07HDF (DPBTRF). The true condition number in the 1-norm is 74.15.
