NAG Library Function Document

nag ode bvp coll nlin setup (d02tvc)

1 Purpose

nag_ode_bvp_coll_nlin_setup (d02tvc) is a setup function which must be called prior to the first call of the nonlinear two-point boundary value solver nag ode bvp coll nlin solve (d02tlc).

2 Specification

3 Description

nag_ode_bvp_coll_nlin_setup (d02tvc) and its associated functions (nag_ode_bvp_coll_nlin_solve (d02tlc), nag_ode_bvp_coll_nlin_contin (d02txc), nag_ode_bvp_coll_nlin_interp (d02tyc) and nag_ode_bvp_coll_nlin_diag (d02tzc)) solve the two-point boundary value problem for a nonlinear system of ordinary differential equations

$$\begin{array}{lcl} y_1^{(m_1)}(x) & = & f_1\bigg(x,y_1,y_1^{(1)},\ldots,y_1^{(m_1-1)},y_2,\ldots,y_n^{(m_n-1)}\bigg) \\ y_2^{(m_2)}(x) & = & f_2\bigg(x,y_1,y_1^{(1)},\ldots,y_1^{(m_1-1)},y_2,\ldots,y_n^{(m_n-1)}\bigg) \\ & \vdots \\ y_n^{(m_n)}(x) & = & f_n\bigg(x,y_1,y_1^{(1)},\ldots,y_1^{(m_1-1)},y_2,\ldots,y_n^{(m_n-1)}\bigg) \end{array}$$

over an interval [a,b] subject to p (> 0) nonlinear boundary conditions at a and q (> 0) nonlinear boundary conditions at b, where $p+q=\sum_{i=1}^n m_i$. Note that $y_i^{(m)}(x)$ is the mth derivative of the ith

solution component. Hence $y_i^{(0)}(x) = y_i(x)$. The left boundary conditions at a are defined as

$$g_i(z(y(a))) = 0, \quad i = 1, 2, \dots, p,$$

and the right boundary conditions at b as

$$\bar{g}_j(z(y(b))) = 0, \quad j = 1, 2, \dots, q,$$

where $y = (y_1, y_2, ..., y_n)$ and

$$z(y(x)) = \left(y_1(x), y_1^{(1)}(x), \dots, y_1^{(m_1-1)}(x), y_2(x), \dots, y_n^{(m_n-1)}(x)\right).$$

See Section 9 for information on how boundary value problems of a more general nature can be treated. nag_ode_bvp_coll_nlin_setup (d02tvc) is used to specify an initial mesh, error requirements and other details. nag ode bvp coll nlin solve (d02tlc) is then used to solve the boundary value problem.

The solution function nag_ode_bvp_coll_nlin_solve (d02tlc) proceeds as follows. A modified Newton method is applied to the equations

$$y_i^{(m_i)}(x) - f_i(x, z(y(x))) = 0, \quad i = 1, \dots, n$$

and the boundary conditions. To solve these equations numerically the components y_i are approximated

by piecewise polynomials v_{ij} using a monomial basis on the *j*th mesh sub-interval. The coefficients of the polynomials v_{ij} form the unknowns to be computed. Collocation is applied at Gaussian points

$$v_{ij}^{(m_i)}ig(x_{jk}ig) - f_iig(x_{jk}, zig(vig(x_{jk}ig)ig)ig) = 0, \quad i = 1, 2, \dots, n,$$

where x_{jk} is the kth collocation point in the jth mesh sub-interval. Continuity at the mesh points is imposed, that is

$$v_{ij}(x_{j+1}) - v_{i,j+1}(x_{j+1}) = 0, \quad i = 1, 2, \dots, n,$$

where x_{j+1} is the right-hand end of the *j*th mesh sub-interval. The linearized collocation equations and boundary conditions, together with the continuity conditions, form a system of linear algebraic equations, an almost block diagonal system which is solved using special linear solvers. To start the modified Newton process, an approximation to the solution on the initial mesh must be supplied via the procedure argument **guess** of nag ode byp coll nlin solve (d02tlc).

The solver attempts to satisfy the conditions

$$\frac{\|y_i - v_i\|}{(1.0 + \|v_i\|)} \le \mathbf{tols}[i-1], \quad i = 1, 2, \dots, n,$$
(1)

where v_i is the approximate solution for the *i*th solution component and **tols** is supplied by you. The mesh is refined by trying to equidistribute the estimated error in the computed solution over all mesh sub-intervals, and an extrapolation-like test (doubling the number of mesh sub-intervals) is used to check for (1).

The functions are based on modified versions of the codes COLSYS and COLNEW (see Ascher *et al.* (1979) and Ascher and Bader (1987)). A comprehensive treatment of the numerical solution of boundary value problems can be found in Ascher *et al.* (1988) and Keller (1992).

5 Arguments

1: **neq** – Integer Input

On entry: n, the number of ordinary differential equations to be solved.

Constraint: $neq \ge 1$.

2: m[neq] – const Integer Input

On entry: $\mathbf{m}[i-1]$ must contain m_i , the order of the *i*th differential equation, for $i=1,2,\ldots,n$. Constraint: $1 \leq \mathbf{m}[i-1] \leq 4$, for $i=1,2,\ldots,n$.

d02tvc.2 Mark 25

3: **nlbc** – Integer

Input

On entry: p, the number of left boundary conditions defined at the left-hand end, a (= **mesh**[0]). Constraint: **nlbc** ≥ 1 .

4: **nrbc** – Integer

Input

On entry: q, the number of right boundary conditions defined at the right-hand end, b = mesh[nmesh - 1]).

Constraints:

$$nrbc \ge 1$$
;

$$\mathbf{nlbc} + \mathbf{nrbc} = \sum_{i=1}^{n} \mathbf{m}[i-1].$$

5: **ncol** – Integer

Input

On entry: the number of collocation points to be used in each mesh sub-interval.

Constraint: $m_{\text{max}} \leq \mathbf{ncol} \leq 7$, where $m_{\text{max}} = \max(\mathbf{m}[i-1])$.

6: **tols**[**neq**] – const double

Input

On entry: tols[i-1] must contain the error requirement for the ith solution component.

Constraint: $100 \times machine\ precision < tols[i-1] < 1.0,\ for\ i = 1, 2, \dots, n.$

7: **mxmesh** – Integer

Input

On entry: the maximum number of mesh points to be used during the solution process.

Constraint: $\mathbf{mxmesh} \ge 2 \times \mathbf{nmesh} - 1$.

8: **nmesh** – Integer

Input

On entry: the number of points to be used in the initial mesh of the solution process.

Constraint: $nmesh \ge 6$.

9: **mesh**[**mxmesh**] – const double

Input

On entry: the positions of the initial **nmesh** mesh points. The remaining elements of **mesh** need not be set. You should try to place the mesh points in areas where you expect the solution to vary most rapidly. In the absence of any other information the points should be equally distributed on [a, b].

 $\mathbf{mesh}[0]$ must contain the left boundary point, a, and $\mathbf{mesh}[\mathbf{nmesh}-1]$ must contain the right boundary point, b.

Constraint: mesh[i-1] < mesh[i], for i = 1, 2, ..., nmesh - 1.

10: **ipmesh**[**mxmesh**] – const Integer

Input

On entry: ipmesh[i-1] specifies whether or not the initial mesh point defined in mesh[i-1], for $i=1,2,\ldots,nmesh$, should be a fixed point in all meshes computed during the solution process. The remaining elements of ipmesh need not be set.

ipmesh[i-1] = 1

Indicates that $\mathbf{mesh}[i-1]$ should be a fixed point in all meshes.

ipmesh[i-1] = 2

Indicates that $\mathbf{mesh}[i-1]$ is not a fixed point.

Mark 25

Constraints:

ipmesh[0] = 1 and **ipmesh**[**nmesh**-1] = 1, (i.e., the left and right boundary points, a and b, must be fixed points, in all meshes);

ipmesh
$$[i-1] = 1$$
 or 2, for $i = 2, 3, ..., nmesh - 1$.

rcomm[**lrcomm**] – double 11:

Communication Array

On exit: contains information for use by nag ode byp coll nlin solve (d02tlc). This must be the same array as will be supplied to nag ode byp coll nlin solve (d02tlc). The contents of this array must remain unchanged between calls.

12: Ircomm - Integer

Input

On entry: the dimension of the array **rcomm**. If lrcomm = 0, a communication array size query is requested. In this case there is an immediate return with communication array dimensions stored in icomm; icomm[0] contains the required dimension of rcomm, while icomm[1] contains the required dimension of icomm.

Constraint:
$$\mathbf{lrcomm} = 0$$
, or $\mathbf{lrcomm} \ge 51 + \mathbf{neq} + \mathbf{mxmesh} \times (2 + m^* + k_n) - k_n + \mathbf{mxmesh}/2$, where $m^* = \sum_{i=1}^n \mathbf{m}[i-1]$ and $k_n = \mathbf{ncol} \times \mathbf{neq}$.

icomm[licomm] - Integer 13:

Communication Array

On exit: contains information for use by nag ode byp coll nlin solve (d02tlc). This must be the same array as will be supplied to nag ode byp coll nlin solve (d02tlc). The contents of this array **must** remain unchanged between calls. If $\mathbf{lrcomm} = 0$, a communication array size query is requested. In this case, on immediate return, icomm[0] will contain the required dimension for **rcomm** while **icomm**[1] will contain the required dimension for **icomm**.

licomm - Integer 14:

Input

On entry: the dimension of the array **icomm**. If lrcomm = 0, a communication array size query is requested. In this case icomm need only be of dimension 2 in order to hold the required communication array dimensions for the given problem and algorithmic parameters.

Constraints:

```
if lrcomm = 0, licomm \ge 2;
otherwise licomm \geq 23 + \text{neq} + \text{mxmesh}.
```

15: fail - NagError *

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

Error Indicators and Warnings 6

NE ALLOC FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE BAD PARAM

On entry, argument (value) had an illegal value.

NE_INT

```
On entry, ipmesh[0] or ipmesh[nmesh - 1] does not equal 1.
```

On entry, **ipmesh** $[i] \neq 1$ or 2 for some i.

```
On entry, \mathbf{licomm} = \langle value \rangle.

Constraint: \mathbf{licomm} \geq \langle value \rangle.

On entry, \mathbf{lrcomm} = \langle value \rangle.

Constraint: \mathbf{lrcomm} = 0 or \mathbf{lrcomm} \geq \langle value \rangle.

On entry, \mathbf{m}[\langle value \rangle] = \langle value \rangle.

Constraint: 1 \leq \mathbf{m}[i-1] \leq 4 for all i.

On entry, \mathbf{neq} = \langle value \rangle.

Constraint: \mathbf{neq} \geq 1.

On entry, \mathbf{nmesh} = \langle value \rangle.

Constraint: \mathbf{nmesh} \geq 6.
```

NE_INT_2

```
On entry, \mathbf{mxmesh} = \langle value \rangle and \mathbf{nmesh} = \langle value \rangle. Constraint: \mathbf{mxmesh} \geq 2 \times \mathbf{nmesh} - 1.

On entry, \mathbf{ncol} = \langle value \rangle and \max(\mathbf{m}[i]) = \langle value \rangle. Constraint: \max(\mathbf{m}[i]) \leq \mathbf{ncol} \leq 7.

On entry, \mathbf{nlbc} = \langle value \rangle and \mathbf{nrbc} = \langle value \rangle. Constraint: \mathbf{nlbc} \geq 1 and \mathbf{nrbc} \geq 1.
```

NE INT 3

```
On entry, \mathbf{nlbc} = \langle value \rangle, \mathbf{nrbc} = \langle value \rangle and \operatorname{sum}(\mathbf{m}[i]) = \langle value \rangle. Constraint: \mathbf{nlbc} + \mathbf{nrbc} = \operatorname{sum}(\mathbf{m}[i]).
```

NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

NE NOT STRICTLY INCREASING

On entry, the elements of mesh are not strictly increasing.

NE_REAL

```
On entry, \mathbf{tols}[\langle value \rangle] = \langle value \rangle.
Constraint: \mathbf{tols}[i-1] > \langle value \rangle for all i.
```

7 Accuracy

Not applicable.

8 Parallelism and Performance

Not applicable.

9 Further Comments

For problems where sharp changes of behaviour are expected over short intervals it may be advisable to:

- use a large value for **ncol**;
- cluster the initial mesh points where sharp changes in behaviour are expected;
- maintain fixed points in the mesh using the argument ipmesh to ensure that the remeshing process does not inadvertently remove mesh points from areas of known interest before they are detected automatically by the algorithm.

9.1 Nonseparated Boundary Conditions

A boundary value problem with nonseparated boundary conditions can be treated by transformation to an equivalent problem with separated conditions. As a simple example consider the system

$$y_1' = f_1(x, y_1, y_2)$$

$$y_2' = f_2(x, y_1, y_2)$$

on [a, b] subject to the boundary conditions

$$g_1(y_1(a)) = 0$$

 $g_2(y_2(a), y_2(b)) = 0$.

By adjoining the trivial ordinary differential equation

$$r' = 0$$
,

which implies r(a) = r(b), and letting $r(b) = y_2(b)$, say, we have a new system

$$y'_1 = f_1(x, y_1, y_2)$$

 $y'_2 = f_2(x, y_1, y_2)$
 $r' = 0.$

subject to the separated boundary conditions

$$g_1(y_1(a)) = 0$$

$$g_2(y_2(a), r(a)) = 0$$

$$y_2(b) - r(b) = 0.$$

There is an obvious overhead in adjoining an extra differential equation: the system to be solved is increased in size.

9.2 Multipoint Boundary Value Problems

Multipoint boundary value problems, that is problems where conditions are specified at more than two points, can also be transformed to an equivalent problem with two boundary points. Each sub-interval defined by the multipoint conditions can be transformed onto the interval [0, 1], say, leading to a larger set of differential equations. The boundary conditions of the transformed system consist of the original boundary conditions and the conditions imposed by the requirement that the solution components be continuous at the interior break-points. For example, consider the equation

$$y^{(3)} = f(t, y, y^{(1)}, y^{(2)})$$
 on $[a, c]$

subject to the conditions

$$y(a) = A$$
$$y(b) = B$$
$$y^{(1)}(c) = C$$

where a < b < c. This can be transformed to the system

$$y_1^{(3)} = f(t, y_1, y_1^{(1)}, y_1^{(2)}) y_2^{(3)} = f(t, y_2, y_2^{(1)}, y_2^{(2)})$$
 on [0, 1]

where

d02tvc.6 Mark 25

$$y_1 \equiv y \quad \text{on} \quad [a, b]$$

 $y_2 \equiv y \quad \text{on} \quad [b, c],$

subject to the boundary conditions

$$\begin{array}{lll} y_1(0) & = & A \\ y_1(1) & = & B \\ y_2^{(1)}(1) & = & C \\ y_2(0) & = & B \text{ (from } y_1(1) = y_2(0)) \\ y_1^{(1)}(1) & = & y_2^{(1)}(0) \\ y_1^{(2)}(1) & = & y_2^{(2)}(0). \end{array}$$

In this instance two of the resulting boundary conditions are nonseparated but they may next be treated as described above.

9.3 High Order Systems

Systems of ordinary differential equations containing derivatives of order greater than four can always be reduced to systems of order suitable for treatment by nag_ode_bvp_coll_nlin_setup (d02tvc) and its related functions. For example suppose we have the sixth-order equation

$$y^{(6)} = -y$$

Writing the variables $y_1 = y$ and $y_2 = y^{(4)}$ we obtain the system

$$y_1^{(4)} = y_2 y_2^{(2)} = -y_1$$

which has maximal order four, or writing the variables $y_1 = y$ and $y_2 = y^{(3)}$ we obtain the system

$$y_1^{(3)} = y_2$$

 $y_2^{(3)} = -y_1$

which has maximal order three. The best choice of reduction by choosing new variables will depend on the structure and physical meaning of the system. Note that you will control the error in each of the variables y_1 and y_2 . Indeed, if you wish to control the error in certain derivatives of the solution of an equation of order greater than one, then you should make those derivatives new variables.

9.4 Fixed Points and Singularities

The solver function nag_ode_bvp_coll_nlin_solve (d02tlc) employs collocation at Gaussian points in each sub-interval of the mesh. Hence the coefficients of the differential equations are not evaluated at the mesh points. Thus, fixed points should be specified in the mesh where either the coefficients are singular, or the solution has less smoothness, or where the differential equations should not be evaluated. Singular coefficients at boundary points often arise when physical symmetry is used to reduce partial differential equations to ordinary differential equations. These do not pose a direct numerical problem for using this code but they can severely impact its convergence.

9.5 Numerical Jacobians

The solver function nag_ode_bvp_coll_nlin_solve (d02tlc) requires an external function **fjac** to evaluate the partial derivatives of f_i with respect to the elements of z(y) (= $\left(y_1,y_1^1,\ldots,y_1^{(m_1-1)},y_2,\ldots,y_n^{(m_n-1)}\right)$). In cases where the partial derivatives are difficult to evaluate, numerical approximations can be used. However, this approach might have a negative impact on the convergence of the modified Newton method. You could consider the use of symbolic mathematic packages and/or automatic differentiation packages if available to you.

See Section 10 in nag_ode_bvp_coll_nlin_diag (d02tzc) for an example using numerical approximations to the Jacobian. There central differences are used and each f_i is assumed to depend on all the

d02tvc NAG Library Manual

components of z. This requires two evaluations of the system of differential equations for each component of z. The perturbation used depends on the size of each component of z and a minimum quantity dependent on the *machine precision*. The cost of this approach could be reduced by employing an alternative difference scheme and/or by only perturbing the components of z which appear in the definitions of the f_i . A discussion on the choice of perturbation factors for use in finite difference approximations to partial derivatives can be found in Gill et al. (1981).

10 Example

The following example is used to illustrate the treatment of nonseparated boundary conditions. See also nag_ode_bvp_coll_nlin_solve (d02tlc), nag_ode_bvp_coll_nlin_contin (d02txc), nag_ode_bvp_coll_nlin_interp (d02tyc) and nag_ode_bvp_coll_nlin_diag (d02tzc), for the illustration of other facilities.

The following equations model of the spread of measles. See Schwartz (1983). Under certain assumptions the dynamics of the model can be expressed as

$$y'_1 = \mu - \beta(x)y_1y_3$$

 $y'_2 = \beta(x)y_1y_3 - y_2/\lambda$
 $y'_3 = y_2/\lambda - y_3/\eta$

subject to the periodic boundary conditions

$$y_i(0) = y_i(1), i = 1, 2, 3.$$

Here y_1, y_2 and y_3 are respectively the proportions of susceptibles, infectives and latents to the whole population. λ (= 0.0279 years) is the latent period, η (= 0.01 years) is the infectious period and μ (= 0.02) is the population birth rate. $\beta(x) = \beta_0(1.0 + \cos 2\pi x)$ is the contact rate where $\beta_0 = 1575.0$.

The nonseparated boundary conditions are treated as described in Section 9 by adjoining the trivial differential equations

$$y'_4 = 0$$

 $y'_5 = 0$
 $y'_6 = 0$

that is y_4, y_5 and y_6 are constants. The boundary conditions of the augmented system can then be posed in the separated form

$$y_1(0) - y_4(0) = 0$$

$$y_2(0) - y_5(0) = 0$$

$$y_3(0) - y_6(0) = 0$$

$$y_1(1) - y_4(1) = 0$$

$$y_2(1) - y_5(1) = 0$$

$$y_3(1) - y_6(1) = 0$$

This is a relatively easy problem and an (arbitrary) initial guess of 1 for each component suffices, even though two components of the solution are much smaller than 1.
