

NAG Library Function Document

nag_4d_shep_eval (e01tlc)

1 Purpose

nag_4d_shep_eval (e01tlc) evaluates the four-dimensional interpolating function generated by nag_4d_shep_interp (e01tkc) and its first partial derivatives.

2 Specification

```
#include <nag.h>
#include <nage01.h>
void nag_4d_shep_eval (Integer m, const double x[], const double f[],
    const Integer iq[], const double rq[], Integer n, const double xe[],
    double q[], double qx[], NagError *fail)
```

3 Description

nag_4d_shep_eval (e01tlc) takes as input the interpolant $Q(\mathbf{x})$, $\mathbf{x} \in \mathbb{R}^4$ of a set of scattered data points (\mathbf{x}_r, f_r) , for $r = 1, 2, \dots, m$, as computed by nag_4d_shep_interp (e01tkc), and evaluates the interpolant and its first partial derivatives at the set of points \mathbf{x}_i , for $i = 1, 2, \dots, n$.

nag_4d_shep_eval (e01tlc) must only be called after a call to nag_4d_shep_interp (e01tkc).

nag_4d_shep_eval (e01tlc) is derived from the new implementation of QS3GRD described by Renka (1988). It uses the modification for high-dimensional interpolation described by Berry and Minser (1999).

5 Arguments

1: **m** – Integer *Input*

On entry: **must** be the same value supplied for argument **m** in the preceding call to nag_4d_shep_interp (e01tkc).

Constraint: **m** ≥ 16 .

2: **x[4 × m]** – const double *Input*

Note: the coordinates of x_r are stored in $\mathbf{x}[(r - 1) \times 4] \dots \mathbf{x}[(r - 1) \times 4 + 3]$.

On entry: **must** be the same array supplied as argument **x** in the preceding call to nag_4d_shep_interp (e01tkc). It **must** remain unchanged between calls.

3: **f[m]** – const double *Input*

On entry: **must** be the same array supplied as argument **f** in the preceding call to nag_4d_shep_interp (e01tkc). It **must** remain unchanged between calls.

4:	iq [$2 \times m + 1$] – const Integer	<i>Input</i>
<i>On entry:</i> must be the same array returned as argument iq in the preceding call to nag_4d_shep_interp (e01tkc). It must remain unchanged between calls.		
5:	rq [$15 \times m + 9$] – const double	<i>Input</i>
<i>On entry:</i> must be the same array returned as argument rq in the preceding call to nag_4d_shep_interp (e01tkc). It must remain unchanged between calls.		
6:	n – Integer	<i>Input</i>
<i>On entry:</i> n , the number of evaluation points.		
<i>Constraint:</i> $n \geq 1$.		
7:	xe [$4 \times n$] – const double	<i>Input</i>
Note: the (i, j) th element of the matrix is stored in xe [($j - 1$) $\times 4 + i - 1$].		
<i>On entry:</i> xe [($r - 1$) $\times 4], \dots, \text{xe}[(r - 1) \times 4 + 3] must be set to the evaluation point xi, for i = 1, 2, \dots, n.$		
8:	q [n] – double	<i>Output</i>
<i>On exit:</i> q [$i - 1$] contains the value of the interpolant, at x_i , for $i = 1, 2, \dots, n$. If any of these evaluation points lie outside the region of definition of the interpolant the corresponding entries in q are set to the largest machine representable number (see nag_real_largest_number (X02ALC)), and nag_4d_shep_eval (e01tlc) returns with fail.code = NE_BAD_POINT.		
9:	qx [$4 \times n$] – double	<i>Output</i>
Note: the (i, j) th element of the matrix is stored in qx [($j - 1$) $\times 4 + i - 1$].		
<i>On exit:</i> qx [($i - 1$) $\times 4 + j - 1$] contains the value of the partial derivatives with respect to x_j of the interpolant $Q(\mathbf{x})$ at x_i , for $i = 1, 2, \dots, n$, and for each of the four partial derivatives $j = 1, 2, 3, 4$. If any of these evaluation points lie outside the region of definition of the interpolant, the corresponding entries in qx are set to the largest machine representable number (see nag_real_largest_number (X02ALC)), and nag_4d_shep_eval (e01tlc) returns with fail.code = NE_BAD_POINT.		
10:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_BAD_POINT

On entry, at least one evaluation point lies outside the region of definition of the interpolant. At all such points the corresponding values in **q** and **qx** have been set to nag_real_largest_number: nag_real_largest_number = $\langle value \rangle$.

NE_INT

On entry, **m** = $\langle value \rangle$.

Constraint: **m** ≥ 16 .

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 1 .

NE_INT_ARRAY

On entry, values in **iq** appear to be invalid. Check that **iq** has not been corrupted between calls to nag_4d_shep_interp (e01tkc) and nag_4d_shep_eval (e01tlc).

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

NE_REAL_ARRAY

On entry, values in **rq** appear to be invalid. Check that **rq** has not been corrupted between calls to nag_4d_shep_interp (e01tkc) and nag_4d_shep_eval (e01tlc).

7 Accuracy

Computational errors should be negligible in most practical situations.

8 Parallelism and Performance

nag_4d_shep_eval (e01tlc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken for a call to nag_4d_shep_eval (e01tlc) will depend in general on the distribution of the data points. If the data points are approximately uniformly distributed, then the time taken should be only $O(n)$. At worst $O(mn)$ time will be required.

10 Example

This program evaluates the function

$$f(x) = \frac{(1.25 + \cos(5.4x_4)) \cos(6x_1) \cos(6x_2)}{6 + 6(3x_3 - 1)^2}$$

at a set of 30 randomly generated data points and calls nag_4d_shep_interp (e01tkc) to construct an interpolating function $Q(\mathbf{x})$. It then calls nag_4d_shep_eval (e01tlc) to evaluate the interpolant at a set of random points.

To reduce the time taken by this example, the number of data points is limited to 30. Increasing this value improves the interpolation accuracy at the expense of more time.

See also Section 10 in nag_4d_shep_interp (e01tkc).
