NAG Library Function Document

nag 1d cheb deriv (e02ahc)

1 Purpose

nag_1d_cheb_deriv (e02ahc) determines the coefficients in the Chebyshev series representation of the derivative of a polynomial given in Chebyshev series form.

2 Specification

3 Description

nag_1d_cheb_deriv (e02ahc) forms the polynomial which is the derivative of a given polynomial. Both the original polynomial and its derivative are represented in Chebyshev series form. Given the coefficients a_i , for i = 0, 1, ..., n, of a polynomial p(x) of degree n, where

$$p(x) = \frac{1}{2}a_0 + a_1T_1(\bar{x}) + \dots + a_nT_n(\bar{x})$$

the function returns the coefficients \bar{a}_i , for $i=0,1,\ldots,n-1$, of the polynomial q(x) of degree n-1, where

$$q(x) = \frac{dp(x)}{dx} = \frac{1}{2}\bar{a}_0 + \bar{a}_1T_1(\bar{x}) + \dots + \bar{a}_{n-1}T_{n-1}(\bar{x}).$$

Here $T_j(\bar{x})$ denotes the Chebyshev polynomial of the first kind of degree j with argument \bar{x} . It is assumed that the normalized variable \bar{x} in the interval [-1,+1] was obtained from your original variable x in the interval $[x_{\min},x_{\max}]$ by the linear transformation

$$\bar{x} = \frac{2x - (x_{\text{max}} + x_{\text{min}})}{x_{\text{max}} - x_{\text{min}}}$$

and that you require the derivative to be with respect to the variable x. If the derivative with respect to \bar{x} is required, set $x_{\text{max}} = 1$ and $x_{\text{min}} = -1$.

Values of the derivative can subsequently be computed, from the coefficients obtained, by using nag 1d cheb eval2 (e02akc).

The method employed is that of Chebyshev series (see Chapter 8 of Modern Computing Methods (1961)), modified to obtain the derivative with respect to x. Initially setting $\bar{a}_{n+1} = \bar{a}_n = 0$, the function forms successively

$$\bar{a}_{i-1} = \bar{a}_{i+1} + \frac{2}{x_{\text{max}} - x_{\text{min}}} 2ia_i, \quad i = n, n-1, \dots, 1.$$

Input

5 Arguments

1: \mathbf{n} - Integer Input

On entry: n, the degree of the given polynomial p(x).

Constraint: $\mathbf{n} \geq 0$.

2: **xmin** – double *Input*

3: xmax – double Input

On entry: the lower and upper end points respectively of the interval $[x_{\min}, x_{\max}]$. The Chebyshev series representation is in terms of the normalized variable \bar{x} , where

$$\bar{x} = \frac{2x - (x_{\text{max}} + x_{\text{min}})}{x_{\text{max}} - x_{\text{min}}}.$$

Constraint: xmax > xmin.

4: $\mathbf{a}[dim]$ – const double

Note: the dimension, dim, of the array **a** must be at least $(1 + (\mathbf{n} + 1 - 1) \times \mathbf{ia1})$.

On entry: the Chebyshev coefficients of the polynomial p(x). Specifically, element $i \times \mathbf{ia1}$ of a must contain the coefficient a_i , for $i = 0, 1, \dots, n$. Only these n + 1 elements will be accessed.

5: **ia1** – Integer Input

On entry: the index increment of **a**. Most frequently the Chebyshev coefficients are stored in adjacent elements of **a**, and **ia1** must be set to 1. However, if for example, they are stored in $\mathbf{a}[0], \mathbf{a}[3], \mathbf{a}[6], \ldots$, then the value of **ia1** must be 3. See also Section 9.

Constraint: $ia1 \ge 1$.

6: patm1 – double * Output

On exit: the value of $p(x_{\min})$. If this value is passed to the integration function nag_1d_cheb_intg (e02ajc) with the coefficients of q(x), then the original polynomial p(x) is recovered, including its constant coefficient.

7: adif[dim] - double

Note: the dimension, dim, of the array adif must be at least $(1 + (n + 1 - 1) \times iadif1)$.

On exit: the Chebyshev coefficients of the derived polynomial q(x). (The differentiation is with respect to the variable x.) Specifically, element $i \times iadif1$ of adif contains the coefficient \bar{a}_i , for $i = 0, 1, \ldots, n-1$. Additionally, element $n \times iadif1$ is set to zero.

8: iadif1 – Integer Input

On entry: the index increment of adif. Most frequently the Chebyshev coefficients are required in adjacent elements of adif, and iadif1 must be set to 1. However, if, for example, they are to be stored in adif[0], adif[3], adif[6],..., then the value of iadif1 must be 3. See Section 9.

Constraint: iadif1 ≥ 1 .

9: fail – NagError * Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

e02ahc.2 Mark 25

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed. See Section 3.2.1.2 in the Essential Introduction for further information.

NE BAD PARAM

On entry, argument \(\value \rangle \) had an illegal value.

NE INT

```
On entry, \mathbf{ia1} = \langle value \rangle.
Constraint: \mathbf{ia1} \ge 1.
On entry, \mathbf{iadif1} = \langle value \rangle.
Constraint: \mathbf{iadif1} \ge 1.
On entry, \mathbf{n} + 1 = \langle value \rangle.
Constraint: \mathbf{n} + 1 \ge 1.
On entry, \mathbf{n} = \langle value \rangle.
Constraint: \mathbf{n} \ge 0.
```

NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in the Essential Introduction for further information.

NE NO LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

NE_REAL_2

```
On entry, \mathbf{xmax} = \langle value \rangle and \mathbf{xmin} = \langle value \rangle. Constraint: \mathbf{xmax} > \mathbf{xmin}.
```

7 Accuracy

There is always a loss of precision in numerical differentiation, in this case associated with the multiplication by 2i in the formula quoted in Section 3.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The time taken is approximately proportional to n+1.

The increments ia1, iadif1 are included as arguments to give a degree of flexibility which, for example, allows a polynomial in two variables to be differentiated with respect to either variable without rearranging the coefficients.

10 Example

e02ahc

Suppose a polynomial has been computed in Chebyshev series form to fit data over the interval [-0.5, 2.5]. The following program evaluates the first and second derivatives of this polynomial at 4 equally spaced points over the interval. (For the purposes of this example, **xmin**, **xmax** and the Chebyshev coefficients are simply supplied. Normally a program would first read in or generate data and compute the fitted polynomial.)
