## nag\_zgbrfs (f07bvc)

### 1 Purpose

nag\_zgbrfs (f07bvc) returns error bounds for the solution of a complex band system of linear equations with multiple right-hand sides,  $AX = B$ ,  $A^T X = B$  or  $A^H X = B$ . It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

### 2 Specification

```
#include <nag.h>
#include <nagf07.h>

                Integer kl, Integer ku, Integer nrhs, const Complex ab[], Integer pdab,

                const Complex b[], Integer pdb, Complex x[], Integer pdx, double ferr[],

```

### 3 Description

nag\_zgbrfs (f07bvc) returns the backward errors and estimated bounds on the forward errors for the solution of a complex band system of linear equations with multiple right-hand sides  $AX = B$ ,  $A^T X = B$  or  $A^H X = B$ . The function handles each right-hand side vector (stored as a column of the matrix  $B$ ) independently, so we describe the function of nag\_zgbrfs (f07bvc) in terms of a single right-hand side  $b$  and solution  $x$ .

Given a computed solution  $x$ , the function computes the *component-wise backward error*  $\beta$ . This is the size of the smallest relative perturbation in each element of  $A$  and  $b$  such that  $x$  is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the function estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where  $\hat{x}$  is the true solution.

For details of the method, see the f07 Chapter Introduction.

### 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by

*On entry:* indicates the form of the linear equations for which  $X$  is the computed solution as follows:

**trans** = Nag\_NoTrans

The linear equations are of the form  $AX = B$ .

**trans** = Nag\_Trans

The linear equations are of the form  $A^T X = B$ .

**trans** = Nag\_ConjTrans

The linear equations are of the form  $A^H X = B$ .

*Constraint:* **trans** = Nag\_NoTrans, Nag\_Trans or Nag\_ConjTrans.

if **order** = Nag\_ColMajor,  $A_{ij}$  is stored as **ab**[( $j - 1$ )  $\times$  **pdab** + **ku** +  $i - j$ ];

if **order** = Nag\_RowMajor,  $A_{ij}$  is stored as **ab**[( $i - 1$ )  $\times$  **pdab** + **kl** +  $j - i$ ].

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.  
See Section 3.6.6 in the Essential Introduction for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.  
See Section 3.6.5 in the Essential Introduction for further information.

**7 Accuracy**

The bounds returned in **fer** are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

**8 Parallelism and Performance**

nag\_zgbrfs (f07bvc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_zgbrfs (f07bvc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

For each right-hand side, computation of the backward error involves a minimum of  $16n(k_l + k_u)$  real floating-point operations. Each step of iterative refinement involves an additional  $8n(4k_l + 3k_u)$  real operations. This assumes  $n \gg k_l$  and  $n \gg k_u$ . At most five steps of iterative refinement are performed, but usually only one or two steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form  $Ax = b$  or  $A^H x = b$ ; the number is usually 5 and never more than 11. Each solution involves approximately  $8n(2k_l + k_u)$  real operations.

The real analogue of this function is nag\_dgbrfs (f07bhc).

**10 Example**

This example solves the system of equations  $AX = B$  using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} -1.65 + 2.26i & -2.05 - 0.85i & 0.97 - 2.84i & 0.00 + 0.00i \\ 0.00 + 6.30i & -1.48 - 1.75i & -3.99 + 4.01i & 0.59 - 0.48i \\ 0.00 + 0.00i & -0.77 + 2.83i & -1.06 + 1.94i & 3.33 - 1.04i \\ 0.00 + 0.00i & 0.00 + 0.00i & 4.48 - 1.09i & -0.46 - 1.72i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -1.06 + 21.50i & 12.85 + 2.84i \\ -22.72 - 53.90i & -70.22 + 21.57i \\ 28.24 - 38.60i & -20.73 - 1.23i \\ -34.56 + 16.73i & 26.01 + 31.97i \end{pmatrix}.$$

Here  $A$  is nonsymmetric and is treated as a band matrix, which must first be factorized by `nag_zgbtrf` (f07brc).
