

## NAG Library Function Document

### nag\_dstevx (f08jbc)

## 1 Purpose

nag\_dstevx (f08jbc) computes selected eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix  $A$ . Eigenvalues and eigenvectors can be selected by specifying either a range of values or a range of indices for the desired eigenvalues.

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_dstevx (Nag_OrderType order, Nag_JobType job, Nag_RangeType range,
                 Integer n, double d[], double e[], double vl, double vu, Integer il,
                 Integer iu, double abstol, Integer *m, double w[], double z[],
                 Integer pdz, Integer jfail[], NagError *fail)
```

## 3 Description

nag\_dstevx (f08jbc) computes the required eigenvalues and eigenvectors of  $A$  by reducing the tridiagonal matrix to diagonal form using the  $QR$  algorithm. Bisection is used to determine selected eigenvalues.

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **job** – Nag\_JobType *Input*

*On entry:* indicates whether eigenvectors are computed.

**job** = Nag\_EigVals  
Only eigenvalues are computed.

**job** = Nag\_DoBoth  
Eigenvalues and eigenvectors are computed.

*Constraint:* **job** = Nag\_EigVals or Nag\_DoBoth.

3: **range** – Nag\_RangeType *Input*

*On entry:* if **range** = Nag\_AllValues, all eigenvalues will be found.

If **range** = Nag\_Interval, all eigenvalues in the half-open interval (**vl**, **vu**] will be found.

If **range** = Nag\_Indices, the **il**th to **iu**th eigenvalues will be found.

*Constraint:* **range** = Nag\_AllValues, Nag\_Interval or Nag\_Indices.

4: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix.

*Constraint:* **n**  $\geq 0$ .

5: **d**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **d** must be at least  $\max(1, n)$ .

*On entry:* the  $n$  diagonal elements of the tridiagonal matrix  $A$ .

*On exit:* may be multiplied by a constant factor chosen to avoid over/underflow in computing the eigenvalues.

6: **e**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **e** must be at least  $\max(1, n - 1)$ .

*On entry:* the  $(n - 1)$  subdiagonal elements of the tridiagonal matrix  $A$ .

*On exit:* may be multiplied by a constant factor chosen to avoid over/underflow in computing the eigenvalues.

7: **vl** – double *Input*

8: **vu** – double *Input*

*On entry:* if **range** = Nag\_Interval, the lower and upper bounds of the interval to be searched for eigenvalues.

If **range** = Nag\_AllValues or Nag\_Indices, **vl** and **vu** are not referenced.

*Constraint:* if **range** = Nag\_Interval, **vl** < **vu**.

9: **il** – Integer *Input*

10: **iu** – Integer *Input*

*On entry:* if **range** = Nag\_Indices, the indices (in ascending order) of the smallest and largest eigenvalues to be returned.

If **range** = Nag\_AllValues or Nag\_Interval, **il** and **iu** are not referenced.

*Constraints:*

if **range** = Nag\_Indices and **n** = 0, **il** = 1 and **iu** = 0;

if **range** = Nag\_Indices and **n** > 0,  $1 \leq \mathbf{il} \leq \mathbf{iu} \leq \mathbf{n}$ .

11: **abstol** – double *Input*

*On entry:* the absolute error tolerance for the eigenvalues. An approximate eigenvalue is accepted as converged when it is determined to lie in an interval  $[a, b]$  of width less than or equal to

$$\mathbf{abstol} + \epsilon \max(|a|, |b|),$$

where  $\epsilon$  is the **machine precision**. If **abstol** is less than or equal to zero, then  $\epsilon \|A\|_1$  will be used in its place. Eigenvalues will be computed most accurately when **abstol** is set to twice the underflow threshold  $2 \times \text{nag\_real\_safe\_small\_number}()$ , not zero. If this function returns with **fail.code** = NE\_CONVERGENCE, indicating that some eigenvectors did not converge, try setting **abstol** to  $2 \times \text{nag\_real\_safe\_small\_number}()$ . See Demmel and Kahan (1990).

12:	<b>m</b> – Integer *	<i>Output</i>
<i>On exit:</i> the total number of eigenvalues found. $0 \leq m \leq n$ .		
If <b>range</b> = Nag_AllValues, <b>m</b> = <b>n</b> .		
If <b>range</b> = Nag_Indices, <b>m</b> = <b>iu</b> – <b>il</b> + 1.		
13:	<b>w[n]</b> – double	<i>Output</i>
<i>On exit:</i> the first <b>m</b> elements contain the selected eigenvalues in ascending order.		
14:	<b>z[dim]</b> – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>z</b> must be at least		
max(1, <b>pdz</b> × <b>n</b> ) when <b>job</b> = Nag_DoBoth; 1 otherwise.		
The $(i, j)$ th element of the matrix $Z$ is stored in		
<b>z</b> $[(j - 1) \times \mathbf{pdz} + i - 1]$ when <b>order</b> = Nag_ColMajor; <b>z</b> $[(i - 1) \times \mathbf{pdz} + j - 1]$ when <b>order</b> = Nag_RowMajor.		
<i>On exit:</i> if <b>job</b> = Nag_DoBoth, then		
if <b>fail.code</b> = NE_NOERROR, the first <b>m</b> columns of $Z$ contain the orthonormal eigenvectors of the matrix $A$ corresponding to the selected eigenvalues, with the <i>i</i> th column of $Z$ holding the eigenvector associated with <b>w</b> [ <i>i</i> – 1];		
if an eigenvector fails to converge ( <b>fail.code</b> = NE_CONVERGENCE), then that column of $Z$ contains the latest approximation to the eigenvector, and the index of the eigenvector is returned in <b>jfail</b> .		
If <b>job</b> = Nag_EigVals, <b>z</b> is not referenced.		
15:	<b>pdz</b> – Integer	<i>Input</i>
<i>On entry:</i> the stride separating row or column elements (depending on the value of <b>order</b> ) in the array <b>z</b> .		
<i>Constraints:</i>		
if <b>job</b> = Nag_DoBoth, <b>pdz</b> $\geq \max(1, n)$ ; otherwise <b>pdz</b> $\geq 1$ .		
16:	<b>jfail[dim]</b> – Integer	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>jfail</b> must be at least max(1, <b>n</b> ).		
<i>On exit:</i> if <b>job</b> = Nag_DoBoth, then		
if <b>fail.code</b> = NE_NOERROR, the first <b>m</b> elements of <b>jfail</b> are zero;		
if <b>fail.code</b> = NE_CONVERGENCE, <b>jfail</b> contains the indices of the eigenvectors that failed to converge.		
If <b>job</b> = Nag_EigVals, <b>jfail</b> is not referenced.		
17:	<b>fail</b> – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_CONVERGENCE

The algorithm failed to converge;  $\langle value \rangle$  eigenvectors did not converge. Their indices are stored in array **jfail**.

### NE\_ENUM\_INT\_2

On entry, **job** =  $\langle value \rangle$ , **pdz** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **job** = Nag\_DoBoth, **pdz**  $\geq \max(1, n)$ ;  
otherwise **pdz**  $\geq 1$ .

### NE\_ENUM\_INT\_3

On entry, **range** =  $\langle value \rangle$ , **il** =  $\langle value \rangle$ , **iu** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **range** = Nag\_Indices and **n** = 0, **il** = 1 and **iu** = 0;  
if **range** = Nag\_Indices and **n** > 0,  $1 \leq \mathbf{il} \leq \mathbf{iu} \leq \mathbf{n}$ .

### NE\_ENUM\_REAL\_2

On entry, **range** =  $\langle value \rangle$ , **vl** =  $\langle value \rangle$  and **vu** =  $\langle value \rangle$ .

Constraint: if **range** = Nag\_Interval, **vl** < **vu**.

### NE\_INT

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 0$ .

On entry, **pdz** =  $\langle value \rangle$ .

Constraint: **pdz** > 0.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

## 7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix  $(A + E)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and  $\epsilon$  is the **machine precision**. See Section 4.7 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

nag\_dstevx (f08jbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_dstevx (f08jbc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of floating-point operations is proportional to  $n^2$  if **job** = Nag\_EigVals and is proportional to  $n^3$  if **job** = Nag\_DoBoth and **range** = Nag\_AllValues, otherwise the number of floating-point operations will depend upon the number of computed eigenvectors.

## 10 Example

This example finds the eigenvalues in the half-open interval (0, 5], and the corresponding eigenvectors, of the symmetric tridiagonal matrix

$$A = \begin{pmatrix} 1 & 1 & 0 & 0 \\ 1 & 4 & 2 & 0 \\ 0 & 2 & 9 & 3 \\ 0 & 0 & 3 & 16 \end{pmatrix}.$$
