

NAG Library Function Document

nag_zhpgst (f08tsc)

1 Purpose

nag_zhpgst (f08tsc) reduces a complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$, where A is a complex Hermitian matrix and B has been factorized by nag_zpptrf (f07grc), using packed storage.

2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zhpgst (Nag_OrderType order, Nag_ComputeType comp_type,
                Nag_UploType uplo, Integer n, Complex ap[], const Complex bp[],
                NagError *fail)
```

3 Description

To reduce the complex Hermitian-definite generalized eigenproblem $Az = \lambda Bz$, $ABz = \lambda z$ or $BAz = \lambda z$ to the standard form $Cy = \lambda y$ using packed storage, nag_zhpgst (f08tsc) must be preceded by a call to nag_zpptrf (f07grc) which computes the Cholesky factorization of B ; B must be positive definite.

The different problem types are specified by the argument **comp_type**, as indicated in the table below. The table shows how C is computed by the function, and also how the eigenvectors z of the original problem can be recovered from the eigenvectors of the standard form.

| comp_type | Problem | uplo | B | C | z |
|---------------|-------------------|------------------------|-------------------|--|--------------------------|
| Nag_Compute_1 | $Az = \lambda Bz$ | Nag_Upper Nag_Lower | $U^H U$ LL^H | $U^{-H} A U^{-1}$ $L^{-1} A L^{-H}$ | $U^{-1} y$ $L^{-H} y$ |
| Nag_Compute_2 | $ABz = \lambda z$ | Nag_Upper Nag_Lower | $U^H U$ LL^H | $U A U^H$ $L^H A L$ | $U^{-1} y$ $L^{-H} y$ |
| Nag_Compute_3 | $BAz = \lambda z$ | Nag_Upper Nag_Lower | $U^H U$ LL^H | $U A U^H$ $L^H A L$ | $U^H y$ $L y$ |

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

- 2: **comp_type** – Nag_ComputeType *Input*
On entry: indicates how the standard form is computed.
comp_type = Nag_Compute_1
 if **uplo** = Nag_Upper, $C = U^{-H}AU^{-1}$;
 if **uplo** = Nag_Lower, $C = L^{-1}AL^{-H}$.
comp_type = Nag_Compute_2 or Nag_Compute_3
 if **uplo** = Nag_Upper, $C = UAU^H$;
 if **uplo** = Nag_Lower, $C = L^HAL$.
Constraint: **comp_type** = Nag_Compute_1, Nag_Compute_2 or Nag_Compute_3.
- 3: **uplo** – Nag_UploType *Input*
On entry: indicates whether the upper or lower triangular part of A is stored and how B has been factorized.
uplo = Nag_Upper
 The upper triangular part of A is stored and $B = U^H U$.
uplo = Nag_Lower
 The lower triangular part of A is stored and $B = LL^H$.
Constraint: **uplo** = Nag_Upper or Nag_Lower.
- 4: **n** – Integer *Input*
On entry: n , the order of the matrices A and B .
Constraint: $n \geq 0$.
- 5: **ap**[*dim*] – Complex *Input/Output*
Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, n \times (n + 1)/2)$.
On entry: the upper or lower triangle of the n by n Hermitian matrix A , packed by rows or columns.
The storage of elements A_{ij} depends on the **order** and **uplo** arguments as follows:
 if **order** = Nag_ColMajor and **uplo** = Nag_Upper,
 A_{ij} is stored in **ap**[($j - 1$) \times $j/2 + i - 1$], for $i \leq j$;
 if **order** = Nag_ColMajor and **uplo** = Nag_Lower,
 A_{ij} is stored in **ap**[($2n - j$) \times ($j - 1$)/2 + $i - 1$], for $i \geq j$;
 if **order** = Nag_RowMajor and **uplo** = Nag_Upper,
 A_{ij} is stored in **ap**[($2n - i$) \times ($i - 1$)/2 + $j - 1$], for $i \leq j$;
 if **order** = Nag_RowMajor and **uplo** = Nag_Lower,
 A_{ij} is stored in **ap**[($i - 1$) \times $i/2 + j - 1$], for $i \geq j$.
On exit: the upper or lower triangle of **ap** is overwritten by the corresponding upper or lower triangle of C as specified by **comp_type** and **uplo**, using the same packed storage format as described above.
- 6: **bp**[*dim*] – const Complex *Input*
Note: the dimension, *dim*, of the array **bp** must be at least $\max(1, n \times (n + 1)/2)$.
On entry: the Cholesky factor of B as specified by **uplo** and returned by nag_zpstrf (f07grc).
- 7: **fail** – NagError * *Input/Output*
The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{n} \geq 0$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

Forming the reduced matrix C is a stable procedure. However it involves implicit multiplication by B^{-1} if (**comp_type** = Nag_Compute_1) or B (if **comp_type** = Nag_Compute_2 or Nag_Compute_3). When nag_zhpgst (f08tsc) is used as a step in the computation of eigenvalues and eigenvectors of the original problem, there may be a significant loss of accuracy if B is ill-conditioned with respect to inversion.

8 Parallelism and Performance

nag_zhpgst (f08tsc) is not threaded by NAG in any implementation.

nag_zhpgst (f08tsc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of real floating-point operations is approximately $4n^3$.

The real analogue of this function is nag_dspgst (f08tec).

10 Example

This example computes all the eigenvalues of $Az = \lambda Bz$, where

$$A = \begin{pmatrix} -7.36 + 0.00i & 0.77 - 0.43i & -0.64 - 0.92i & 3.01 - 6.97i \\ 0.77 + 0.43i & 3.49 + 0.00i & 2.19 + 4.45i & 1.90 + 3.73i \\ -0.64 + 0.92i & 2.19 - 4.45i & 0.12 + 0.00i & 2.88 - 3.17i \\ 3.01 + 6.97i & 1.90 - 3.73i & 2.88 + 3.17i & -2.54 + 0.00i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 3.23 + 0.00i & 1.51 - 1.92i & 1.90 + 0.84i & 0.42 + 2.50i \\ 1.51 + 1.92i & 3.58 + 0.00i & -0.23 + 1.11i & -1.18 + 1.37i \\ 1.90 - 0.84i & -0.23 - 1.11i & 4.09 + 0.00i & 2.33 - 0.14i \\ 0.42 - 2.50i & -1.18 - 1.37i & 2.33 + 0.14i & 4.29 + 0.00i \end{pmatrix},$$

using packed storage. Here B is Hermitian positive definite and must first be factorized by `nag_zpptrf` (`f07grc`). The program calls `nag_zhpgst` (`f08tsc`) to reduce the problem to the standard form $Cy = \lambda y$; then `nag_zhptrd` (`f08gsc`) to reduce C to tridiagonal form, and `nag_dsterf` (`f08jfc`) to compute the eigenvalues.
