## 3 Description

nag\_dtgsja (f08yec) computes the GSVD of the matrices  $A$  and  $B$  which are assumed to have the form as returned by nag\_dggsvp (f08vec)

$$A = \begin{cases} k \begin{pmatrix} n-k-l & k & l \\ 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix}, & \text{if } m-k-l \geq 0; \\ m-k-l \begin{pmatrix} 0 & 0 & 0 \end{pmatrix}, & \text{if } m-k-l < 0; \end{cases}$$

$$B = \begin{cases} l \begin{pmatrix} n-k-l & k & l \\ 0 & A_{12} & A_{13} \\ 0 & 0 & A_{23} \end{pmatrix}, & \text{if } m-k-l \geq 0; \\ p-l \begin{pmatrix} 0 & 0 & B_{13} \\ 0 & 0 & 0 \end{pmatrix}, & \text{if } m-k-l < 0; \end{cases}$$

where the  $k$  by  $k$  matrix  $A_{12}$  and the  $l$  by  $l$  matrix  $B_{13}$  are nonsingular upper triangular,  $A_{23}$  is  $l$  by  $l$  upper triangular if  $m-k-l \geq 0$  and is  $(m-k)$  by  $l$  upper trapezoidal otherwise.

nag\_dtgsja (f08yec) computes orthogonal matrices  $Q$ ,  $U$  and  $V$ , diagonal matrices  $D_1$  and  $D_2$ , and an upper triangular matrix  $R$  such that

$$U^T A Q = D_1 \begin{pmatrix} 0 & R \end{pmatrix}, \quad V^T B Q = D_2 \begin{pmatrix} 0 & R \end{pmatrix}.$$

Optionally  $Q$ ,  $U$  and  $V$  may or may not be computed, or they may be premultiplied by matrices  $Q_1$ ,  $U_1$  and  $V_1$  respectively.

If  $(m - k - l) \geq 0$  then  $D_1$ ,  $D_2$  and  $R$  have the form

$$D_1 = \begin{matrix} & k & l \\ & I & 0 \\ m - k - l & 0 & C \\ & 0 & 0 \end{matrix},$$

$$D_2 = \begin{matrix} & k & l \\ & 0 & S \\ p - l & 0 & 0 \end{matrix},$$

$$R = \begin{matrix} & k & l \\ k & R_{11} & R_{12} \\ l & 0 & R_{22} \end{matrix},$$

where  $C = \text{diag}(\alpha_{k+1}, \dots, \alpha_{k+l})$ ,  $S = \text{diag}(\beta_{k+1}, \dots, \beta_{k+l})$ .

If  $(m - k - l) < 0$  then  $D_1$ ,  $D_2$  and  $R$  have the form

$$D_1 = \begin{matrix} & k & m - k & k + l - m \\ & I & 0 & 0 \\ m - k & 0 & C & 0 \end{matrix},$$

$$D_2 = \begin{matrix} & k & m - k & k + l - m \\ m - k & 0 & S & 0 \\ k + l - m & 0 & 0 & I \\ p - l & 0 & 0 & 0 \end{matrix},$$

$$R = \begin{matrix} & k & m - k & k + l - m \\ m - k & R_{11} & R_{12} & R_{13} \\ k + l - m & 0 & R_{22} & R_{23} \\ & 0 & 0 & R_{33} \end{matrix},$$

where  $C = \text{diag}(\alpha_{k+1}, \dots, \alpha_m)$ ,  $S = \text{diag}(\beta_{k+1}, \dots, \beta_m)$ .

In both cases the diagonal matrix  $C$  has non-negative diagonal elements, the diagonal matrix  $S$  has positive diagonal elements, so that  $S$  is nonsingular, and  $C^2 + S^2 = 1$ . See Section 2.3.5.3 of Anderson *et al.* (1999) for further information.

## 7 Accuracy

The computed generalized singular value decomposition is nearly the exact generalized singular value decomposition for nearby matrices  $(A + E)$  and  $(B + F)$ , where

$$\|E\|_2 = O\epsilon\|A\|_2 \quad \text{and} \quad \|F\|_2 = O\epsilon\|B\|_2,$$

and  $\epsilon$  is the *machine precision*. See Section 4.12 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

`nag_dtgsja` (f08yec) is not threaded by NAG in any implementation.

`nag_dtgsja` (f08yec) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The complex analogue of this function is `nag_ztgsja` (f08ysc).

## 10 Example

This example finds the generalized singular value decomposition

$$A = U\Sigma_1(0 \quad R)Q^T, \quad B = V\Sigma_2(0 \quad R)Q^T,$$

of the matrix pair  $(A, B)$ , where

$$A = \begin{pmatrix} 1 & 2 & 3 \\ 3 & 2 & 1 \\ 4 & 5 & 6 \\ 7 & 8 & 8 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} -2 & -3 & 3 \\ 4 & 6 & 5 \end{pmatrix}.$$
