3 Description

nag_ztgsja (f08ysc) computes the GSVD of the matrices A and B which are assumed to have the form as returned by nag_zggsvp (f08vsc)

$$A = \begin{cases} \begin{pmatrix} & & n-k-l & k & l \\ & k & & & \\ & & 0 & A_{12} & A_{13} \\ & l & & & \\ m-k-l & & 0 & 0 & A_{23} \\ & & & 0 & 0 \\ & & & & 0 \end{pmatrix}, & \text{if } m-k-l \geq 0; \\ \begin{pmatrix} & & n-k-l & k & l \\ & k & & & \\ & & 0 & A_{12} & A_{13} \\ & & & & \\ m-k & & 0 & 0 & A_{23} \end{pmatrix}, & \text{if } m-k-l < 0; \end{cases}$$

$$B = \begin{pmatrix} & & n-k-l & k & l \\ & l & & & \\ & & 0 & & B_{13} \\ p-l & & 0 & & \\ & & & 0 & 0 \end{pmatrix},$$

where the k by k matrix A_{12} and the l by l matrix B_{13} are nonsingular upper triangular, A_{23} is l by l upper triangular if $m-k-l \geq 0$ and is $(m-k)$ by l upper trapezoidal otherwise.

nag_ztgsja (f08ysc) computes unitary matrices Q , U and V , diagonal matrices D_1 and D_2 , and an upper triangular matrix R such that

$$U^H A Q = D_1 \begin{pmatrix} 0 & R \end{pmatrix}, \quad V^H B Q = D_2 \begin{pmatrix} 0 & R \end{pmatrix}.$$

Optionally Q , U and V may or may not be computed, or they may be premultiplied by matrices Q_1 , U_1 and V_1 respectively.

If $(m - k - l) \geq 0$ then D_1 , D_2 and R have the form

$$D_1 = \begin{matrix} & & k & l \\ & & I & 0 \\ & l & 0 & C \\ m - k - l & & 0 & 0 \end{matrix},$$

$$D_2 = \begin{matrix} & & k & l \\ & & 0 & S \\ & l & 0 & 0 \\ p - l & & 0 & 0 \end{matrix},$$

$$R = \begin{matrix} & & k & l \\ & & R_{11} & R_{12} \\ & l & 0 & R_{22} \\ m - k - l & & 0 & 0 \end{matrix},$$

where $C = \text{diag}(\alpha_{k+1}, \dots, \alpha_{k+l})$, $S = \text{diag}(\beta_{k+1}, \dots, \beta_{k+l})$.

If $(m - k - l) < 0$ then D_1 , D_2 and R have the form

$$D_1 = \begin{matrix} & & k & m - k & k + l - m \\ & & I & 0 & 0 \\ & k & 0 & C & 0 \\ m - k & & 0 & 0 & 0 \end{matrix},$$

$$D_2 = \begin{matrix} & & k & m - k & k + l - m \\ & & 0 & S & 0 \\ & m - k & 0 & 0 & I \\ & k + l - m & 0 & 0 & 0 \\ p - l & & 0 & 0 & 0 \end{matrix},$$

$$R = \begin{matrix} & & k & m - k & k + l - m \\ & & R_{11} & R_{12} & R_{13} \\ & k & 0 & R_{22} & R_{23} \\ & m - k & 0 & 0 & R_{33} \\ k + l - m & & 0 & 0 & 0 \end{matrix},$$

where $C = \text{diag}(\alpha_{k+1}, \dots, \alpha_m)$, $S = \text{diag}(\beta_{k+1}, \dots, \beta_m)$.

In both cases the diagonal matrix C has real non-negative diagonal elements, the diagonal matrix S has real positive diagonal elements, so that S is nonsingular, and $C^2 + S^2 = 1$. See Section 2.3.5.3 of Anderson *et al.* (1999) for further information.

8 Parallelism and Performance

nag_ztgsja (f08ysc) is not threaded by NAG in any implementation.

nag_ztgsja (f08ysc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The real analogue of this function is nag_dtgsja (f08yec).

This example finds the generalized singular value decomposition
