

## NAG Library Function Document

### nag\_dger (f16pmc)

## 1 Purpose

nag\_dger (f16pmc) performs a rank-1 update on a real general matrix.

## 2 Specification

```
#include <nag.h>
#include <nagf16.h>

void nag_dger (Nag_OrderType order, Nag_ConjType conj, Integer m, Integer n,
               double alpha, const double x[], Integer incx, const double y[],
               Integer incy, double beta, double a[], Integer pda, NagError *fail)
```

## 3 Description

nag\_dger (f16pmc) performs the rank-1 update operation

$$A \leftarrow \alpha xy^T + \beta A,$$

where  $A$  is an  $m$  by  $n$  real matrix,  $x$  is an  $m$  element real vector,  $y$  is an  $n$ -element real vector, and  $\alpha$  and  $\beta$  are real scalars. If  $m$  or  $n$  is equal to zero or if  $\beta$  is equal to one and  $\alpha$  is equal to zero, this function returns immediately.

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **conj** – Nag\_ConjType *Input*

*On entry:* the argument **conj** is not referenced if  $x$  and  $y$  are real vectors. It is suggested that you set **conj** = Nag\_NoConj where the elements  $y_i$  are not conjugated.

*Constraint:* **conj** = Nag\_NoConj.

3: **m** – Integer *Input*

*On entry:*  $m$ , the number of rows of the matrix  $A$ .

*Constraint:* **m**  $\geq 0$ .

4:	<b>n</b> – Integer	<i>Input</i>
<i>On entry:</i> $n$ , the number of columns of the matrix $A$ .		
<i>Constraint:</i> $n \geq 0$ .		
5:	<b>alpha</b> – double	<i>Input</i>
<i>On entry:</i> the scalar $\alpha$ .		
6:	<b>x</b> [ <i>dim</i> ] – const double	<i>Input</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>x</b> must be at least $\max(1, 1 + (n - 1) \text{incx} )$ .		
<i>On entry:</i> the vector $x$ .		
7:	<b>incx</b> – Integer	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of <b>x</b> between successive elements of $x$ .		
<i>Constraint:</i> $\text{incx} \neq 0$ .		
8:	<b>y</b> [ <i>dim</i> ] – const double	<i>Input</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>y</b> must be at least $\max(1, 1 + (n - 1) \text{incy} )$ .		
<i>On entry:</i> the vector $y$ .		
9:	<b>incy</b> – Integer	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of <b>y</b> between successive elements of $y$ .		
<i>Constraint:</i> $\text{incy} \neq 0$ .		
10:	<b>beta</b> – double	<i>Input</i>
<i>On entry:</i> the scalar $\beta$ .		
11:	<b>a</b> [ <i>dim</i> ] – double	<i>Input/Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>a</b> must be at least		
$\max(1, \text{pda} \times n)$ when <b>order</b> = Nag_ColMajor;		
$\max(1, m \times \text{pda})$ when <b>order</b> = Nag_RowMajor.		
If <b>order</b> = Nag_ColMajor, $A_{ij}$ is stored in <b>a</b> [( <i>j</i> – 1) × <b>pda</b> + <i>i</i> – 1].		
If <b>order</b> = Nag_RowMajor, $A_{ij}$ is stored in <b>a</b> [( <i>i</i> – 1) × <b>pda</b> + <i>j</i> – 1].		
<i>On entry:</i> the $m$ by $n$ matrix $A$ .		
<i>On exit:</i> the updated matrix $A$ .		
12:	<b>pda</b> – Integer	<i>Input</i>
<i>On entry:</i> the stride separating row or column elements (depending on the value of <b>order</b> ) in the array <b>a</b> .		
<i>Constraints:</i>		
if <b>order</b> = Nag_ColMajor, <b>pda</b> $\geq \max(1, m)$ ;		
if <b>order</b> = Nag_RowMajor, <b>pda</b> $\geq n$ .		
13:	<b>fail</b> – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry,  $\mathbf{incx} = \langle value \rangle$ .

Constraint:  $\mathbf{incx} \neq 0$ .

On entry,  $\mathbf{incy} = \langle value \rangle$ .

Constraint:  $\mathbf{incy} \neq 0$ .

On entry,  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{m} \geq 0$ .

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

### NE\_INT\_2

On entry,  $\mathbf{pda} = \langle value \rangle$ ,  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{pda} \geq \max(1, \mathbf{m})$ .

On entry,  $\mathbf{pda} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{pda} \geq \mathbf{n}$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

## 7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

The argument **conj** is not referenced in this case where  $x$  and  $y$  are real vectors.

## 10 Example

Perform rank-1 update of real matrix  $A$  using vectors  $x$  and  $y$ :

$$A \leftarrow A - xy^T,$$

where  $A$  is the 3 by 2 matrix given by

$$A = \begin{pmatrix} 3.0 & 2.0 \\ 3.0 & 4.0 \\ 5.0 & 9.0 \end{pmatrix},$$

$$x = (2.0, 3.0, 5.0)^T \quad \text{and} \quad y = (0.0, 1.0, 0.0)^T.$$
