NAG Library Function Document

nag_zhpr (f16sqc)

1   Purpose

nag_zhpr (f16sqc) performs a Hermitian rank-1 update on a complex Hermitian matrix stored in packed form.

2   Specification

```
#include <nag.h>
#include <nagf16.h>
```
```
void nag_zhpr (Nag_OrderType order, Nag_UploType uplo, Integer n,
     double alpha, const Complex x[], Integer incx, double beta,
     Complex ap[], NagError *fail)
```

3   Description

nag_zhpr (f16sqc) performs the Hermitian rank-1 update operation

$$A \leftarrow \alpha x x^{\mathrm{H}} + \beta A,$$

where A is an n by n complex Hermitian matrix, stored in packed form, x is an n-element complex vector, while α and β are real scalars.

Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001) *Basic Linear Algebra Subprograms Technical (BLAST) Forum Standard* University of Tennessee, Knoxville, Tennessee http://www.netlib.org/blas/blast-forum/blas-report.pdf

5   Arguments

1:   **order** – Nag_OrderType   *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2:   **uplo** – Nag_UploType   *Input*

On entry: specifies whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper
     The upper triangular part of A is stored.

uplo = Nag_Lower
     The lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3:   **n** – Integer   *Input*

On entry: n, the order of the matrix A.

Constraint: **n** ≥ 0.

4:    **alpha** – double   *Input*

   On entry: the scalar α.

5:    **x**[*dim*] – const Complex   *Input*

   Note: the dimension, *dim*, of the array **x** must be at least $\max(1, 1 + (\mathbf{n} - 1)|\mathbf{incx}|)$.

   On entry: the vector x.

6:    **incx** – Integer   *Input*

   On entry: the increment in the subscripts of **x** between successive elements of x.

   Constraint: $\mathbf{incx} \neq 0$.

7:    **beta** – double   *Input*

   On entry: the scalar β.

8:    **ap**[*dim*] – Complex   *Input/Output*

   Note: the dimension, *dim*, of the array **ap** must be at least $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$.

   On entry: the n by n Hermitian matrix A, packed by rows or columns.

   The storage of elements A_{ij} depends on the **order** and **uplo** arguments as follows:

   > if **order** = Nag_ColMajor and **uplo** = Nag_Upper,
   > A_{ij} is stored in $\mathbf{ap}[(j - 1) \times j/2 + i - 1]$, for $i \leq j$;
   > if **order** = Nag_ColMajor and **uplo** = Nag_Lower,
   > A_{ij} is stored in $\mathbf{ap}[(2n - j) \times (j - 1)/2 + i - 1]$, for $i \geq j$;
   > if **order** = Nag_RowMajor and **uplo** = Nag_Upper,
   > A_{ij} is stored in $\mathbf{ap}[(2n - i) \times (i - 1)/2 + j - 1]$, for $i \leq j$;
   > if **order** = Nag_RowMajor and **uplo** = Nag_Lower,
   > A_{ij} is stored in $\mathbf{ap}[(i - 1) \times i/2 + j - 1]$, for $i \geq j$.

   On exit: the updated matrix A. The imaginary parts of the diagonal elements are set to zero.

9:    **fail** – NagError *   *Input/Output*

   The NAG error argument (see Section 3.6 in the Essential Introduction).

6   Error Indicators and Warnings

NE_ALLOC_FAIL

   Dynamic memory allocation failed.
   See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

   On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

   On entry, **incx** = $\langle value \rangle$.
   Constraint: $\mathbf{incx} \neq 0$.

   On entry, **n** = $\langle value \rangle$.
   Constraint: $\mathbf{n} \geq 0$.

NE_INTERNAL_ERROR

   An unexpected error has been triggered by this function. Please contact NAG.
   See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

7   Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8   Parallelism and Performance

Not applicable.

9   Further Comments

None.

10   Example

Perform rank-1 update of complex Hermitian matrix A, stored in packed storage format, using vector x:

$$A \leftarrow A - xx^{\mathrm{H}},$$

where A is the 4 by 4 Hermitian matrix given by

$$A = \begin{pmatrix} 4.0 + 0.0i & 7.0 - 4.0i & -0.6 \ +2.2i & -4.0 + 3.0i \\ 7.0 + 4.0i & 14.0 + 0.0i & 0.3 \ +1.2i & -4.7 - 2.1i \\ -0.6 - 2.2i & 0.3 - 1.2i & 2.04 + 0.0i & -5.9 - 0.1i \\ -4.0 - 3.0i & -4.7 + 2.1i & -5.9 \ +0.1i & 6.0 + 0.0i \end{pmatrix},$$

and

$$x = \begin{pmatrix} 2.0 + 1.0i \\ 2.0 + 3.0i \\ 0.2 - 1.0i \\ -1.0 - 2.0i \end{pmatrix}.$$
